**How to Build a Model Railway** David Ashwood, Market Deeping, 2022-11-08 Moving from a train set out of a box to making your own model railway can seem a daunting proposition. Whether you go your own way, wish to follow a prototype tightly or have an inherited stock that you want to make the best of. This book covers the act of deciding on a design that will keep the interest alive. Executing it in a manner that is within your skills set, and finishing it to a quality you are satisfied by within a time and financial limit. Here learning from those who have had both successes and the occasional false start will assist you in execution of your project and maintaining its interest. The book aims to explain jargon and includes such subjects as project design and planning, alternative baseboard construction methods, track laying, basic electrics accompanied by a rich and varied imagery. The Market Deeping Model railway club rose to public notice in May 2019 following the sad overnight vandalism of their annual railway show. The breaking news story became a worldwide cause célèbre bringing a whirlwind of kind support from modelers and the general public. The rebuilding of the club's damaged layouts and new projects for replacements gave the rare opportunity of experienced modelers to photograph and document the build process and revisit the basics. The results are incorporated into this book making a positive and cathartic activity from a distinctly negative situation.

### **Towards concurrent planning of railway maintenance and train services**

Lidén, 2016-09-05 Efficiency in the public and freight transportation systems is of crucial importance for a society. Railways can offer high capacity and relatively low environmental impact, but require that several technical systems are tuned and operate well. Specifically there is a very tight interdependency between infrastructure and trains, which distinguishes railways from other transportation modes. Thus maintenance of all the subsystems is needed. Railways do also have some specific and complicating properties that influence maintenance and operations: Most activities need exclusive access to the infrastructure and - due to the geographic layout, safety requirements and partitioning of the subsystems - large portions of the network will be affected by each activity. Furthermore, several organisational units and resources are involved, ranging from governments and regulatory bodies, over operators and contractors to suppliers, technical experts and work forces. Thus railway maintenance is complicated to organize and consumes large budgets. This thesis treats the planning and scheduling problems that concern railway infrastructure maintenance and the coordination with train traffic. Mathematical methods and optimization are

studied and used, with the aim of advancing the knowledge about models for solving such problems. The thesis contains three papers and presents: (1) A survey regarding railway maintenance activities, the major planning problems and the conducted research so far; (2) A model for quantitative comparison and assessment of competing capacity requests from train operations and maintenance; (3) An optimization model for integrated scheduling of both maintenance windows and train services. The work can be helpful for practitioners as well as researchers who want to take further steps in this interesting and challenging area. Based on the results that have been obtained, future research directions are presented that may lead towards practical use of concurrent planning of railway maintenance and train services.
