*Maya Glyphs* Linda Schele,2013-12-18 The key to the study of the language and history of the Classic Maya (A.D. 293–900) is the verb. *Maya Glyphs: The Verbs* is a comprehensive study of the verb morphology and syntax of the Maya writing system. Linda Schele's summary of methodology makes available in a single place many important discoveries and approaches to the Maya language. Hers is the first sourcebook to include so broad a range of dates and to identify for the first time so many Maya rulers and events. The admirably lucid text provides an excellent introduction to Maya hieroglyphics for the beginner, and, for the experienced Mayanist, it offers a fascinating explanation of methodology, including paraphrasing, and important information about syntactical structures, special verbal constructions, and literary conventions. Schele's extensive catalog of known verbal phrases is useful for a variety of purposes. Because it is organized according to verbal affix patterns, it provides the only available source for the distribution of such patterns in the writing system. At the same time it registers the date of each event, its agent and patient (if recorded), the dedication date of the monument on which the glyphs occur, and a pictorial illustration, rather than a T-number transcription, of each example. Extensive notes treating problems of dating, interpretation, and dynastic information contain theories about the meaning and function of the events recorded in the Maya inscriptions.

**Metamaterials for Manipulation of Thermal Radiation and Photoluminescence in Near and Far Fields** Yinhui Kan,2022-09-20 This book provides a series of methods for flexibly and actively manipulating thermal emission and photoluminance by advanced nanostructures—metamaterials. Nanostructures in subwavelength scales can be designed to precisely modulate light-matter interactions and thereby tailoring both thermal radiations and photon emissions. This book explores approaches for designing different kinds of nanostructures, including multilayers, gratings, nanoridges, and waveguides, to improve the flexibility and functionality of micro/nanodevices. With the help of these subwavelength nanostructures, thermal radiation and photoluminescence have been fully manipulated in near and far fields regarding to the intensity, spectrum, polarization, and direction. The proposed methods together with designed metamaterials open new avenues for designing novel micro-/nanodevices or systems for promising applications like thermal energy harvesting, detecting, sensing, and on-chip quantum-optical networks.
