Alphard: Form and Content Mary Shaw,2012-12-06 Alphard is a design for a programming system that supports the abstraction and verification techniques required by modern program'ming methodology. During the language design process, we were concerned simultaneously with problems of methodology, correctness, and efficiency. Methodological concerns are addressed through facilities for defining new, task-specific abstractions that capture complex notions in terms of their intended properties, without explicating them in terms of specific low· level implementations. Techniques for verifying certain properties of these programs address the correctness concerns. Finally, the language has been designed to permit compilation to efficient object code. Although a compiler was not implemented, the research shed light on specification issues and on programming methodology. an abstraction, specifying its behavior Alphard language constructs allow a programmer to isolate publicly while localizing knowledge about its implementation. The verification of such an abstraction consists of showing that its implementation behaves in accordance with the public specification. Given such a verification, the abstraction may be used with confidence to construct higher·level, more abstract, programs. The most common kind of abstraction in Alphard corresponds to what is now called an abstract data type. An abstract data type comprises a set of values for elements of the type and a set of operations on those values. A new language construct, the form, provides a way to encapsulate the definitions of data structures and operations in such a way that only public information could be accessed by the rest of the program.

Brady's Book of Fixed Stars Bernadette Brady,1998-01-15 For the first time, this book offers astrologers: Paran Maps and Star Phases for over 60 stars; new insights into the natal use of fixed stars, as well as their use in mundane astrology; extensive appendices of Heliacal Rising and Acronychal Settinggraphs and tables so that, for any given location, the dates of these risings and settings can be found; a list of 176 stars with their 21st century Ptolemaic precessed positions versus their commonly-considered positions based on Ulugh Beg's methods.

ALPHARD William Allan Wulf,CARNEGIE-MELLON UNIV PITTSBURGH PA DEPT OF COMPUTER SCIENCE.,Carnegie-Mellon University. Computer Science Department,1974 This report discusses the programming language tools needed to support the expression of 'well-structured' programs. In particular it deals with the tools needed to express abstractions and their realizations; to this end it introduces the concept of a 'form' to subsume the notions of type (mode), macro, procedure, generator, and coercion. An extendedexample is given together with the sketch of a proof of the example. The proof is included to support the contention that formal verification is substantially simplified when the abstractions and their realization are retained in the program text. (Author).

Abstraction and verification in alphard: iteration and generators M. Shaw,Carnegie-Mellon University. Computer Science Department,W. A. Wulf,R. L. London,1976 The Alphard form provides the programmer with a great deal of control over the implementation of abstract data types. In this report we extend the abstraction techniques from simple data representation and function definition to the iteration statement, the most important point of interaction between data and the control structure of the language itself. We introduce a means of specializing Alphard's loops to operate on abstract entities without explicit dependence on the representation of those entities. We develop specification and verification techniques that allow the properties of such iterations to be expressed in the form of proof rules. We also provide a means of showing that a generator will terminate and obtain results for common special cases that are essentially identical to the corresponding constructs in other languages.
