Status of Little Spotted Kiwi (Apteryx Owenii) on Tiritiri Matangi Island in April 2017 Hugh Alexander Robertson,Natasha Coad,Rogan Colbourne,James R. Fraser (Wildlife conservationist),2019 The little spotted kiwi (*Apteryx owenii*) is the second rarest kiwi species in New Zealand, making the monitoring of its population essential. We caught 31 little spotted kiwi (28 adults, 2 subadults and 1 juvenile) on Tiritiri Matangi Island between 17 and 30 April 2017, including 3 of the 14 founders introduced from Kapiti Island in the mid-1990s and 9 island-bred birds that had been banded during 5-yearly monitoring visits between 1997 and 2012. Based on the locations of captures, radio-tagged birds, sightings and the projected origins of calls heard, we estimated that there were at least 25 pairs and a total population of 60-80 kiwi on Tiritiri Matangi Island. This represents a decline from the 2012 estimate of 80-100 birds, possibly due to the severe drought that was experienced in early 2013. However, the birds were generally in good to excellent condition and were heavier than their conspecifics on Kapiti Island at that time of year. At the end of our survey, 10 adult females were transferred to Shakespear Open Sanctuary at the tip of the adjacent Whangaparaoa Peninsula and 10 new adult females were introduced from Kapiti Island in an attempt to increase the genetic diversity of the Tiritiri Matangi Island population. However, the maximum of 24 founders is still below the 40 founders that is usually recommended. Therefore, we recommend that at least 10 additional kiwi are transferred to Tiritiri Matangi Island to improve the genetic resilience of the population to challenges such as diseases or environmental perturbations, and that 5-yearly monitoring and annual call counts are continued.

New Zealand, Its Physical Geography, Geology and Natural History Ferdinand von Hochstetter,Edward Sauter,1867 Inhabited by Polynesians since the thirteenth century and discovered by Europeans in the seventeenth, New Zealand is a geologically diverse island group where active volcanoes and frequent earthquakes have resulted in a rich variety of rock formations and geothermal activity. In 1859-60, the geologist Ferdinand von Hochstetter (1829-84) was employed by Auckland's government to undertake the first systematic geological survey of the islands, the results of which were first published in German in 1863 and translated into this English version in 1867. Hochstetter describes his travels across New Zealand, his encounters with native people and his scientific observations. He analyses plants, wildlife and fossils, describes mountains, rocks and boiling springs, and evaluates evidence of glaciers and tectonic activity. As a result of Hochstetter's work, several species in New Zealand were named after him. This book remains a valuable resource in the history of Australasian natural science'-- Publisher.

Noah's Ravens James O. Farlow,2018-10-08 How can the tracks of dinosaurs best be interpreted and used to reconstruct them? In many Mesozoic sedimentary rock formations, fossilized footprints of bipedal, three-toed (tridactyl) dinosaurs are preserved in huge numbers, often with few or no skeletons. Such tracks sometimes provide the only clues to the former presence of dinosaurs, but their interpretation can be challenging: How different in size and shape can footprints be and yet have been made by the same kind of dinosaur? How similar can they be and yet have been made by different kinds of dinosaurs? To what extent can tridactyl dinosaur footprints serve as proxies for the biodiversity of their makers? Profusely illustrated and meticulously researched, Noah's Ravens quantitatively explores a variety of approaches to interpreting the tracks, carefully examining within-species and across-species variability in foot and footprint shape in nonavian dinosaurs and their close living relatives. The results help decipher one of the world's most important assemblages of fossil dinosaur tracks, found in sedimentary rocks deposited in ancient rift valleys of eastern North America. Those often beautifully preserved tracks were among the first studied by paleontologists, and they were initially interpreted as having been made by big birds—one of which was jokingly identified as Noah's legendary raven.

Handbook to the Birds of Australia by John Gould, 1865

Extinct Birds Julian P. Hume, 2017-08-24 A comprehensive review of the hundreds of bird species that have become extinct over the last 1,000 years of habitat degradation, over-hunting and rat introduction. *Extinct Birds* has become the standard text on this subject, covering both familiar icons of extinction as well as more obscure birds, some known from just one specimen or from travellers' tales. This second edition is expanded to include dozens of new species, as more are constantly added to the list, either through extinction or through new subfossil discoveries. The book is the result of decades of research into literature and museum drawers, as well as caves and subfossil deposits, which often reveal birds long-gone that disappeared without ever being recorded by scientists while they lived. From Great Auks, Carolina Parakeets and Dodos to the amazing yet almost completely vanished bird radiations of Hawaii and New Zealand via rafts of extinction in the Pacific and elsewhere, this book is both a sumptuous reference and astounding testament to humanity's devastating impact on wildlife.
