## **From Autogiro to Gyroplane** Bruce H. Charnov,2003-07-30

Predating the invention of the helicopter by two decades, the Autogiro was the world's first rotary-wing aircraft. The helicopter had the advantageous ability to rise straight up, while the Autogiro/gyroplane could only taxi. Yet the gyroplane was safer and more stable; both aircraft should have had value in market. Why did the helicopter survive and prosper, while the Autogiro became a nearly forgotten historical footnote? Why didn't the Autogiro catch on, and why is it being revived today? This is the first book to tell the fascinating 80-year history of today's gyroplane and its antecedent, the Autogiro. Charnov explains that the near-eclipse of the Autogiro was caused by a potent combination of bad luck, the impact of the Great Depression and World War II, and egregious business decisions. Only by understanding the amazing manner in which this aviation technology has persisted and evolved can one fully understand the basis for its future. In contrast to the fate of the Autogiro, the gyroplane's unfolding story is characterized by successful business models, effective decision making, and the emergence of cutting-edge technology. The survival of the gyroplane may be a paradigm for the persistence of earlier, less complex technologies, and its future relies on grasping its colorful history.

*Fairey Rotodyne* David Gibbings, 2011-11-08 The Fairey Rotodyne was a large British compound helicopter designed and built by the Fairey Aviation Company and intended for commercial and military applications. It was considered to be one of the iconic aviation projects of the 1950s/60s and a bright future was planned for the aircraft. Widely accepted to be a revolutionary design, it was economically viable, fast and capable of vertical take-off and landing from city centre heliports. However, despite the proven feasibility of this bold concept, the Rotodyne project was terminated in 1962 due to escalating development costs and unresolved technical issues. This book seeks to fill a gap in aviation literature on the history of the Rotodyne, an aircraft ahead of its time. Winner of Hampshire Libraries Special Collections Award 2010.

An Overview of Autogyros and the McDonnell XV-1 Convertiplane National Aeronautics and Space Administration (NASA), 2018-08-20 This report and its lengthy appendix first reviews early autogyro history. The period from Juan de la Cierva's invention in the early 1920s through to the U. S. Army Air Corps' choice, in 1943, of the helicopter instead of the more fully developed autogyro, is examined from a technical point of view. With this historical background in hand, simple aerodynamic technology for rotors, wings, propeller, and fuselages is provided for reference. The McDonnell XV-1 convertiplane development and its program are discussed in detail, with particular emphasis on the wind tunnel and flight testing that was accomplished with two prototype aircraft in the early 1950s. The tip drive rotor system with its ingeniously designed hub was well suited to high speed rotorcraft. The configuration was conceived by Kurt Hohenemser and Fred Dubloff. Many photographs taken of the XV-1 stored at Fort Rucker are included in this report's appendix. Harris, Franklin D. Ames Research Center NAG2-1597; WU SAT292004D

An Introduction to Ultralight Gyroplanes Dave Organ, 2002

Gyroplanes are mechanically simple in construction and stable in the air - hence their growing popularity. They are far more versatile than any fixed wing aircraft, are impossible to stall and yet are capable of speeds in excess of 100 mph. They can - in certain wind conditions - hover or even fly backwards; can descend vertically under complete control and can make safe, controlled landings, in the event of engine failure.--Back cover.
