Ball Python Care: The Complete Guide to Caring for and Keeping Ball Pythons as Pets Tabitha Jones, 2019-03-06 The Ball Python (scientifically named *Python Regius*) is a species that originates from sub-Saharan Africa. The name is based upon the fact that the animal has a tendency to curl itself into a ball when under attack, stressed or frightened. The species is also commonly known as the Royal Python. The name Royal Python anecdotally comes from the fact that African royalty would wear Ball Pythons around their necks as a form of living jewelry. Like other pythons, the Ball Python is a non-venomous constrictor. Ball Pythons are common house hold pets due to their relatively small size, docile temperament and the fact that they are non-venomous. Ball Pythons are large bodied snakes. They come in a wide variety of colours and morphs (genetic mutations). However, the snakes colorings tend to be more earthy: browns, beiges, or black with gold and white markings. The snakes bellies are usually white or cream and may contain black markings. The snakes body is normally stocky with the head being relatively small in comparison. The scales of the Ball Python are smooth. This book was previously published under the same name by 'Pet Care Professionals.'

*Ball Pythons in Captivity* Kevin McCurley, 2006-01-01 This book details the caging, feeding, health issues, breeding, and egg incubation of ball pythons.

**Ball Python** Kelly Dwayne,2020-08-30 The ball python, otherwise called the illustrious python, is a python species found in sub-Saharan Africa. Like every single other python, it is a nonvenomous constrictor. This is the littlest of the African pythons and is famous in the pet exchange, to a great extent because of its little size and ordinarily quiet personality. The color markings of adult ball pythons range from medium to dark chocolate brown, and juveniles range from yellow or yellow-brown to chocolate brown. The most commonly observed ball python pattern shows 15 to 25 large, pale, rounded blotches along each side of the neck and body. Dark interspaces separate the blotches and connect to the darker dorsal area. The posterior body and tail are the darker color, with a pale vertebral stripe that halts just short of the tip. The ventral surface is off-white or pale grey with some grey flecks. The pattern is disruptive in that the observable profile of the snake is interrupted by the contrasting pattern arrangement, and considerable variation exists between individuals. The eyes appear completely black until closer inspection reveals the dark iris and pupil. The neck is slender, giving the snake a diminutive appearance. Selective breeding has produced some spectacular specimens that only resemble the wild or common ball python in body shape. This beginners guide provides vital information on the behavior of ball python, how to house, feed, teaching them how to feed, knowing their common health condition and taking proper care of them.
