And that, in a dark and divided world, she is more valuable than she ever would have believed. For with each passing night, Reyna can't shake the sensation that it's Beckham who's afraid of her. Molecular Biology and Evolution of Blood Group and MHC Antigens in Primates Antoine Blancher, Jan Klein, Wladyslaw W. Socha, 2012-12-06 Zoologists have categorized primates into a single order, and no one doubts today that they share a common ancestry. Humans and Old and New World non human primate species, from the lemurs of Madagascar to the African anthropoid apes, represent diverging branches of an evolutionary common trunk. Along with species-specific characters, all primates have retained a number of ancestral traits, relics of their common origin. The comparative study of these species-specific and ancestral traits makes it possible to reconstruct the evolutionary pathways of humans and nonhuman primates. The

discovery of the human blood groups and, later, of the Major Histocompatibility Complex (MHC) had a seminal effect on the field of human genetics, providing the first sound examples of Mendelian polymorphisms. The use of blood group and MHC alleles as genetic markers in biological anthropology generated a conceptual revolution and persuaded researchers to begin to think in terms of populations and not only in terms of typology. The counterparts of these human red and white cell antigens were found and studied in nonhuman primates, and progress in this field is summarized in this book.
