The Boyle Papers Michael Hunter, 2018-05-08 Robert Boyle (1627-91) was the most influential British scientist of the late seventeenth century. His huge archive, which has been at the Royal Society since 1769, has only recently been explored, leading to a new understanding of many aspects of Boyle's thought. This volume brings together the essential materials for understanding the Boyle Papers. It includes a revised version of Michael Hunter's fundamental study of the archive, first published in 1992, which elucidates its history and the way in which

handwriting evidence can be used to identify chronological strata within it, thus making it possible to trace the development of Boyle's ideas. Other chapters deal with such components of the Papers as Boyle's 'workdiaries' and his projected Paralipomena; another uses material from the archive to illuminate the making of a key work by Boyle, his Free Inquiry into the Vulgarly Receiv'd Notion of Nature; while another illustrates that, large as the archive is, it is only a part of what existed in Boyle's lifetime. Parts of the content have been published before, but they are here presented in revised and fully indexed form. Lastly, the volume includes a completely revised version of the catalogue of the Boyle Papers, Letters and ancillary manuscripts originally published in 1992, updating it by tabulating the extensive use of the archive made in recent years in connection with the publication of the definitive editions of Boyle's Works and Correspondence (1999-2001). In all, the volume will be indispensable to anyone with a serious interest in Boyle.

Biological Clock in Fish Ewa Kulczykowska,Włodzimierz Popek,B.G. Kapoor,2010-05-27 Each organism has its own internal biological clock, which is reset by environmental cues (Zeitgebers), thus keeping it synchronized with the external environment. It is a chemically based oscillating system within cells, relying on molecular feedback loops. Circadian biological clocks exist in most organisms. What is so special about the clock in fish? Where is it located—in the retina, inside the brain, or in the pineal? What is the molecular basis of its function? How is the clock able to keep time in the absence of environmental cues? Although biological clocks have been intensively studied over the past four decades, only recently have the tools needed to examine the molecular basis of circadian rhythms become available. This book reviews the state of knowledge in sufficient detail and presents the latest contributions to the field, showing fish provide a unique model of the circadian biological clock.

**How Can Development and Plasticity Contribute to Understanding Evolution of the Human Brain?** Roberto Lent,Fernanda Tovar-Moll,2016-07-19 Humans usually attribute themselves the prerogative of being the pinnacle of evolution. They have large brains with many billion neurons and glial cells, trillions of synapses and besides all, a plastic hardware that may change either subtly or strongly in response to the external environment and internal, mental commands. With this hypercomplex apparatus, they are capable of very sophisticated inward computations and outward behaviors that include self-recognition, metacognition, different forms of language expression and reception, prediction of future events, planning and performing long streams of motor acts, subtle emotional feelings, and many other surprising, almost unbelievable properties. The main challenge for research is: how do we explain this gigantic achievement of evolution? Is it a direct consequence of having acquired a brain larger than our primate ancestors, with huge numbers of computational units? Would it be determined by a particular way these units came to relate to each other, building up logic circuits of powerful capacities? What along development has "made the difference" for the construction of such a complex brain machine? How much of this complexity is innate, how much is sculpted by influence of the external world, by social interaction with our human fellows, and by the history of our own mental trajectory along life? Many specific questions can be asked

(albeit not necessarily answered so far) to this purpose: (1) which genomic characteristics make us unique among primates? (2) which of developmental events during and beyond embryogenesis define our brain – prolonged neurogenesis? permanent circuit (re)formation? dynamic synaptogenesis? regressive sculpting of the hardware? all of them? (3) is there anything special about plasticity of the human brain that allows us to build the exquisite individual variability characteristic of our brains? Neuroscience is in need of a synthesis. Perhaps associating concepts derived from developmental neurobiology with evolutionary morphology and physiology, together with those that photograph the human brain in action under influence of the external world, would turn on a light at the end of the tunnel, and we would be able to understand what humans do have that is special – if anything – to explain our success in the Earth.
