Klaus Wilhelm-Heinz Radtke

Introduction to California Chaparral Ronald D. Quinn, Dr. Sterling Keeley, 2006-09-20 The characteristic look of California Chaparral—a soft bluish-green blanket of vegetation gently covering the hills—is known to millions who have seen it as the backdrop in movies and television productions. This complex ecological community of plants and animals is not just a feature of the hills around Hollywood, but is a quintessential part of the entire California landscape. It is a highly resilient community adapted to life with recurring fires and droughts. Written for a wide audience, this concise, engaging, and beautifully illustrated book describes an ancient and exquisitely balanced environment home to wondrous organisms: Fire Beetles that mate only on burning branches, lizards that shoot blood from their eyes when threatened, Kangaroo Rats that never drink water, and seeds that germinate only after a fire, even if that means waiting in the soil for a 100 years or more. Useful both as a field guide and an introductory overview of the ecology of chaparral, it also provides a better understanding of how we might live in harmony, safety, and appreciation of this unique ecological community. * Identifies chaparral's common plants, animals, birds, reptiles, amphibians, and insects * Features 79 color illustrations, 56 black-and-white photographs, and 3 maps * Examines the role of humans and fire in chaparral, covering the placement and design of homes, landscaping, and public policy

Chaparral Edward R. Ricciuti, 1996 Defines chaparral biomes and covers where they are located as well as the plants and animals that inhabit them.

Valuing Chaparral Emma C. Underwood, Hugh D. Safford, Nicole A. Molinari, Jon E. Keeley, 2018-04-09 Chaparral shrubland ecosystems are an iconic feature of the California landscape, and a highly biodiverse yet highly flammable backdrop to some of the fastest growing urban areas in the United States. Chaparral-type ecosystems are a common element of all of the world's Mediterranean-type climate regions – of which California is one – yet there is little public appreciation of the intrinsic value and the ecosystem services that these landscapes provide. Valuing Chaparral is a compendium of contributions from experts in chaparral ecology and management, with a focus on the human relationship with chaparral ecosystems. Chapters cover a wide variety of subjects, ranging from biodiversity to ecosystem services like water provision, erosion control, carbon sequestration and recreation; from the history of human interactions with chaparral to current education and conservation efforts; and from chaparral restoration and management to scenarios of the future under changing climate, land use, and human population. Valuing Chaparral will be of interest to resource managers, the research community, policy makers, and the public who live and work in the chaparral dominated landscapes of California and other Mediterranean-type climate regions.

Chaparral Shrubs Steve W. Chadde, 2020-12-09 Chaparral Shrubs is a field guide to 132 shrub and subshrub species found in the chaparral of southern California. Each species is described and illustrated with color photographs, and a simple key to all species, based on vegetative features, is included to aid identification. Descriptions include details of the plant's growth-form, typical habitats and elevation range where found, blooming-period, fire response, wildlife values, and traditional human uses. A distribution map indicates known occurrence of each shrub in California. The guide is fully indexed, and a glossary defines the botanical terms used. The guide will be valuable for students, resource managers, fire specialists, and anyone desiring to learn more about California's diverse native flora.

Resource Use by Chaparral and Matorral P.C. Miller, 2012-12-06 The comparative study of mediterranean type ecosystems has gained considerable momentum during the past two decades. Modern studies on these systems date from the work of Ray Specht, who studied the dynamics of the heath vegetation of southern Australia. The results of these studies first appeared in 1957 (Specht and Rayson, 1957) and were summarized in 1973 (Specht, 1973). Specht followed this detailed work, which pointed to the central role of nutrients in limiting the productivity of the Australian heath, with a general comparison of the structural features of woody plant communities in mediterranean type ecosystems of Australia, southern France, and southern California (Specht, 1969a,b). The comparative studies emphasized remarkable convergent features of these ecosystems, particularly in relation to structural features affecting primary production. Naveh (1967) also did comparative studies focusing on grassland types that occur in the mediterranean climatic zones of California and Israel. About this same time, independent studies by Mooney and Dunn (1970 a,b) and Mooney et al. (1970) made preliminary structural and functional comparisons of the vegetations of mediterranean type ecosystems in California and Chile in an attempt to derive an evolutionary model explaining the basis of their convergent natures. Much of the knowledge of these ecosystems up to 1973 was summarized in volume 7 of Ecological Studies, Mediterranean Type Ecosystems: Origin and Structure (di Castri and Mooney, 1973). This volume builds on its series predecessor in many ways.

Habitat Preferences and Distribution of Mammals in California Chaparral Ronald D. Quinn, 1990 Forty-nine species of mammals regularly occur in California chaparral, but none lives only in chaparral. Among the 49 species, 7 are found primarily in mature chaparral, 9 in young chaparral or along ecotones between chaparral and other plant communities, and 19 in riparian areas. Five species occur in many habitats but prefer chaparral in California, and 9 have wide ranges that encompass many communities including chaparral. By altering the structure of the plant community, fire in chaparral is important in determining the distribution and abundance of mammalian populations. Fire is not permanently destructive to the mammalian fauna. Wildlife habitat can be optimized by maintaining chaparral in many age classes, by restricting fuel reduction treatments to 1 to 100 ha, by protecting all trees, and by enhancing water sources. A given area of chaparral contains two to four common, and two to nine total, species of rodents. Seeds, fruits, and young vegetative growth are the most important plant foods in chaparral. Only 12 species of mammals are endemic to chaparral because of the limited opportunity in both time and space for speciation to occur. Only kangaroo rats (Dipodomys) and chipmunks (Eutamias) have speciated in chaparral.

Living More Safely in the Chaparral-urban Interface Klaus William-Heinz Radtke,1983 Urban encroachment into chaparral areas has accelerated the fire-flood-erosion cycle. Preventive maintenance measures can help reduce the damage from fire and flood. This report describes the chaparral environment; how to cope with problems in watershed management, how to landscape for fire and soil erosion control, how to plan for home safety from fire, how to treat newly burned chaparral slopes, how to clear brush around homes; and what to do when caught in a wildfire. The information reported is addressed to homeowners, buyers, and developers; and architects, planners, and other officials in municipalities and agencies.
