Effect of Blade Cutout on Power Required by Helicopters Operating at High Tip-speed Ratios Alfred Gessow,F. B. Gustafson,1960

Stresses in a Compressively Loaded Circular Semimonocoque Cylinder with a Cutout R. E. Martin,1967

Effective Widths of Compression-loaded Plates with a Cutout Mark W. Hilburger,2000 A study of the effects of cutouts and laminate construction on the prebuckling and initial postbuckling stiffnesses, and the effective widths of compression-loaded, laminated-composite and aluminum square plates is presented. The effective-width concept is extended to plates with cutouts, and experimental and nonlinear finite-element analysis results are presented. Behavioral trends are compared for seven plate families and for cutout-diameter-to-plate-width ratios up to 0.66. A general compact design curve that can be used to present and compare the effective widths for a wide range of laminate constructions is also presented. A discussion of how the results can be used and extended to include certain types of damage, cracks, and other structural discontinuities or details is given. Several behavioral trends are described that initially appear to be nonintuitive. The results demonstrate a complex interaction between cutout size and plate orthotropy that affects the axial stiffness and effective width of a plate subjected to compression loads.

Stress Analysis of Circular Semimonocoque Cylinders with Cutouts by a Perturbation Load Technique Harvey G. McComb,1954 A method is presented for analyzing the stresses about a cutout in a circular cylinder of monocoque construction. The method involves the use of so-called perturbation solutions which are superposed on the stress distribution that would exist in the structure with no cutout in such a way as to give the effects of a cutout. The method can be used for any loading case for which

the structure without the cutout can be analyzed and is sufficiently versatile to account for stringer and shear reinforcement about the cutout.

Design Aids for Stiffened Composite Shells with Cutouts

Sarmila Sahoo, 2016-09-16 This book focuses on the free vibrations of graphite-epoxy laminated composite stiffened shells with cutout both in terms of the natural frequencies and mode shapes. The dynamic analysis of shell structures, which may have complex geometry and arbitrary loading and boundary conditions, is solved efficiently by the finite element method, even including cutouts in shells. The results may be readily used by practicing engineers dealing with stiffened composite shells with cutouts. Several shell forms viz. cylindrical shell, hypar shell, conoidal shell, spherical shell, saddle shell, hyperbolic paraboloidal shell and elliptic paraboloidal shell are considered in the book. The dynamic characteristics of stiffened composite shells with cutout are described in terms of the natural frequency and mode shapes. The size of the cutouts and their positions with respect to the shell centre are varied for different edge constraints of cross-ply and angle-ply laminated composite shells. The effects of these parametric variations on the fundamental frequencies and mode shapes are considered in detail. The information regarding the behavior of stiffened shells with cutouts for a wide spectrum of eccentricity and boundary conditions for cross ply and angle ply shells may be used as design aids for structural engineers. The book is a significant contribution to the existing literature from the point of view of both industrial importance and academic interest.

Stresses Around Rectangular Cutouts in Torsion Boxes

Paul Kuhn, James P. Peterson, 1953 A method is presented for calculating the stresses produced by rectangular cutouts of any size in torsion boxes. The problem is divided into a box problem and a cover problem. The box problem is a special case of the general method of analyzing torsion boxes without cutouts. In the cover problem, simple shear-lag theory is used to obtain key

stresses; the final distributions are obtained from these key stresses by means of simple rules or empirical distribution curves. Comparisons with the results from three series of tests in which the dimensions of the cutouts varied over a wide range are shown.

Stresses in and General Instability of Monocoque Cylinders with Cutouts Nicholas John Hoff,1949 All but one cylinder failed in general instability. The one that did not show the general-instability pattern failed in tension.

A Method for Calculating Stresses in Torsion-box Covers with Cutouts Richard Rosecrans,1951 Stresses in the covers of torsion boxes containing large cutouts are found by changing half of the symmetrical uncut portion of the cover into three stringers carrying direct stress and intermediate cover material carrying shear stress. Illustrative examples are solved and the results are compared with experimental values. For one example, the results are compared with a more detailed numerical method of analysis. The agreement between theory and experiment is satisfactory in all cases except those with very large cutouts and flexible bulkheads.

The Cutout Francine Mathews,2001-10-30 CUTOUT: A third person used to conceal the contact between two people. A pawn. They were partners — lovers in a business where betrayal is a heartbeat away. CIA analyst Caroline Carmichael lost her husband Eric when his plane was blown out of the sky by an elite group of terrorists known as 30 April. Now her dead husband has surfaced among those responsible for an explosion that rocks Berlin — and the brutal kidnapping of the U.S. Vice President. Uncertain of Eric's motives and loyalties, the Agency plays its last, best card: Eric's wife — the Cutout. Is Eric a rogue agent gone bad? Or has he

thrown himself under deep cover to terminate a ruthless psychopath? Caroline is drawn into a dizzying maze where one wrong turn will mean certain death ... and in which the Cutout will be the first to fall.
