Daniel Logan

The Deimos Incident Daniel Logan,2019-11-04 NASA is conducting a series of deep space missions to land on Mars. Because of the one-year round trip of each mission and the need for self-reliance due to the enormous distance from Earth, the spacecraft human crews are commanded by an android who never tires and is always vigilant. The missions are launched from the International Space Station to perform a series of landings on the tiny Martian moon, Phobos, in order to build a staging base for the ultimate descent and landing on the surface of Mars. Madison Lambert, serving as the Chief Astronaut on the space station, receives a distress call from the crew of the spacecraft saying they need immediate help. The plea throws Madison and others at Mission Control into turmoil as they feverishly work to initiate a response filled with danger.

Phobos & Deimos John Moehl,2016-08-10 Many of us live dual lives, as though we live in two worlds. This divergence is perhaps greatest for those embedded in what may be called multiculturalism. Multicultural people, with their unique life experiences, are migrating around the globe, carrying their own baggage while they face the demands of living in new and strange lands. The short stories in this collection look at the daily tests facing people, frequently in Africa, as they struggle to survive, often in a rapidly changing world. These observations are made through the lens of an outsider--someone from a different culture, with different habits, seeing and learning how these trials are met--seeing and learning that people, regardless of ethnicity, share a common humanity that makes taking these tests poignant and, at times, a true reflection of the human condition. The stories focus on farmers and families, business and traditional leaders, the poor and the rich as they move through life's pathways, not knowing the changes in store for tomorrow. The stories tell tales of sadness and success, while underscoring the common denominators we all share. The stories may be seen as representing a different world, but they most likely represent the whole world.

Exploring the Martian Moons Manfred "Dutch" von Ehrenfried,2017-04-11 This book explores the once popular idea of 'Flexible Path' in terms of Mars, a strategy that would focus on a manned orbital mission to Mars's moons rather than the more risky, expensive and time-consuming trip to land humans on the Martian surface. While currently still not the most popular idea, this mission would take advantage of the operational, scientific and engineering lessons to be learned from going to Mars's moons first. Unlike a trip to the planet's surface, an orbital mission avoids the dangers of the deep gravity well of Mars and a very long stay on the surface. This is analogous to Apollo 8 and 10, which preceded the landing on the Moon of Apollo 11. Furthermore, a Mars orbital mission could be achieved at least five years, possibly 10 before a landing mission. Nor would an orbital mission require all of the extra vehicles, equipment and supplies needed for a landing and a stay on the planet for over a year. The cost difference between the two types of missions is in the order of tens of billions of dollars. An orbital mission to Deimos and Phobos would provide an early opportunity to acquire scientific knowledge of the moons and Mars as well, since some of the regolith is presumed to be soil ejected from Mars. It may also offer the opportunity to deploy scientific instruments on the moons which would aid subsequent missions. It would provide early operational experience in the Mars environment without the risk of a landing. The author convincingly argues this experience would enhance the probability of a safe and successful Mars landing by NASA at a later date, and lays out the best way to approach an orbital mission in great detail. Combining path-breaking science with achievable goals on a fast timetable, this approach is the best of both worlds--and our best path to reaching Mars safely in the future.

The Morphology of Phobos and Deimos Peter Chew Thomas,1978 Imagery from Mariner 9 and the Viking Orbiter was used to study the surface features of Phobos and Deimos. The high density of the impact craters shows that the surfaces are generally more than one billion years old, and may be three times that age. Most of the debris ejected from impact craters on Phobos is permanently lost from the satellite because of its low gravity and proximity to Mars. Deimos retains more of its cratering debris. Both satellites have large blocks among their retained ejecta. The grooves on Phobos are surface expressions, in a loose regolith, of deeper fractures that were formed or widened by the impact that created the Stickney crater. The grooves diminish in size and number away from Stickney and they are absent in the area opposite that crater. Deimos lacks grooves, perhaps because of a difference in cratering history or in the mechanical properties of the two satellites.
