Clinical Immunobiology Fritz H. Bach,Robert A. Good,2014-06-28 Clinical Immunobiology, Volume 2 covers the advances in the field being made to apply bone marrow transplantation to the treatment of several diseases. This volume is divided into 11 chapters and begins with surveys of the clinical considerations of bone marrow transplantation. Considerable chapters are devoted to the application of this transplantation to the treatment of various diseases, including aplastic anemia, aregenerative pancytopenia, leukemia, uniformly fatal severe combined immunodeficiency diseases, and Wiskott-Aldrich syndrome. Other chapters examine the cellular engineering in the form of bone marrow and thymus transplantation. The remaining chapters consider the effects of exposure to excessive amounts of radiation or cytotoxic chemicals, as well as the hematopoietic failure based on malfunction of the complex process of normal hematological development and maintenance. This book will be of great value to clinical immunobiologists, practicing physicians, researchers, and medical and biology

students.

**The Immunologic Revolution** Andor Szentivanyi, Herman Friedman, 1993-10-25 This unique volume contains reviews by some of the most prominent immunologists in the world. The authors present vital facts for each of their areas of expertise and provide individual perspectives on how their own contributions were developed and how these contributions influenced general immunological thinking and development. This impressive collection of personal reviews by these internationally renowned immunologists makes *The Immunologic Revolution* an important and lasting contribution to the entire biomedical community.

**Immunodermatology** Bijan Safai, Robert A. Good, 2013-11-11 By 1940, immunological mechanisms had been proved to have fundamental influences on a great number and variety of skin reactions, and skin diseases had brought to light a great number of fundamental immunological mechanisms that were basic to a wide range of different diseases, dermatological and nondermatological. The preeminence of dermatological research in the advancement of immunological knowledge should not astonish anyone. For the skin is not only the most easily accessible tissue for producing and studying immunological reactions, it is also the great organ of protection that meets the first onslaughts of inimical environmental forces and agents-potential enemies, both living and dead. And protection is in essence what immunology is all about. To get an idea of the long-established role that testing the skin and the study of its many reactions has played in advancing general immunology, one need recall only smallpox vaccination; tuberculin testing; testing with fungal extracts; skin testing in hay fever, asthma, and serum sickness; skin tests with toxins and toxoids; the patch test; the passive transfer of skin-adhering antibodies (reagins); skin sensitization by simple chemicals; and similar dermatological procedures that have exerted their influence on medical and scientific disciplines far beyond dermatology.

**Biological Effects of Dietary Restriction** Lawrence Fishbein, 2012-12-06 How does dietary restriction affect the physiological and biochemical state of laboratory animals? How will the present conclusions affect further research? What are the implications for human health and safety assessment? These are the main questions asked in this book by leading international researchers. After a first look at feeding regimens and diets of laboratory animals, the book elaborates on a variety of age-associated toxicological and pathological endpoints including tumor development. The following sections detail the underlying mechanisms which may induce the broad spectrum of physiological and

biochemical changes. This summary of current multidisciplinary research will enhance understanding of the practical applications and implications of dietary restriction.

**The Immunopathology of Lymphoreticular Neoplasms** J. Twomey, 2012-12-06 Until recently, understanding of the lymphomas was limited and largely descriptive. Attention has been focused, for the most part, upon morphological issues and clinical matters. Although useful, this approach has many shortcomings. The true cytoidentity of primary neoplastic cells was not established by these methods, nor could their clonal nature be recognized. The more overt changes in immunological function, such as monoclonal gammopathies and immunodeficiencies, were appreciated as important components of these diseases. However, subtle immunological perturbations were not recognized. Furthermore, associations were not established between the lymphoreticular neoplasms on the one hand and both primary and secondary immunological abnormalities on the other. There has been considerable recent progress in the fields of immunobiology, cytology, and immunochemistry. These new approaches have proved readily applicable to studies on the lymphomas. The term lymphoma has been applied to a heterogeneous group of neoplasms that involve lymphoid tissues. This term is not altogether satisfactory, since it implies that cells of primarily the lymphoid series are involved in the neoplastic process. Some neoplasms, heretofore classified as lymphomas, now appear, from the results of penetrating analysis using newer methodology, to be malignancies of the macrophage series, rather than of the lymphocytic series. These neoplasms include Hodgkin's disease and a minority of neoplasms previously referred to as histiocytic lymphomas. The majority of these histiocytic lymphomas are now known to be lymphoid malignancies involving the B-cell series.

Microenvironmental Aspects of Immunity B. Jankovic, 2012-12-06

**Recombinant DNA Research**, 1990-12

**Human Gene Therapy**, 1987

Inborn Errors of Immunity and Phagocytosis F. Güttler, J.W.T. Seakins, R. Angus

Harkness, 2012-12-06 The rapid growth of immunology has greatly increased our understanding of disease; this growth has also generated a subject which at times appears separated from some of the basic medical sciences. Recent studies in the areas of purine metabolism and of polymorphonuclear neutrophil phagocyte function have, however, linked immunology and clinical medicine with biochemistry. The precise defects of the inborn errors of metabolism have now provided good evidence for the importance of purine metabolism specifically the enzymes adenosine deaminase and nucleoside phosphorylase in lymphocyte function. In view of this and the steady advance of clinical

and biochemical investigation of the polymorphonuclear neutrophil phago cyte, it appeared timely to review the inborn errors of immunity and phagocytosis at the fifteenth annual symposium of the Society for the Study of Inborn Errors of Metabolism at Elsinore, Denmark on September 11-14th, 1977. The papers presented at that meeting form the basis of this volume which brings together contributions from immunologists, biochemists and clinicians. This interdisciplinary communication should be helpful to those concerned with immune function in their patients or in the laboratory. The book is divided into four sections, One: defects of cell-mediated immunity, Two: enzyme defects and immunodeficiency, Three: disorders of non-specific immunity and Four: screening for immunodeficiency. Section One contains two reviews, one on immunodeficiency from Robert Good's group in New York and another on the genetics of the immune system from Arne Svegaard of Copenhagen.

**Caloric Restriction: A Key to Understanding and Modulating Aging** E.J. Masoro, 2002-12-20 For many years, it has been known that when rats and mice are given a reduced amount of food, their life span is increased and they remain healthy and vigorous at advanced ages. What is the reason for this change in the usual pattern of aging? The evidence is overwhelming that the life extension results from a slowing of aging processes. And the factor responsible is the decrease in caloric intake. The obvious question: How does this factor work? A good question - and the reason that research on the anti-aging action of caloric restriction is today one of the most studied research areas in biological gerontology. For it is felt that if the biological mechanisms of the anti-aging action of caloric restriction can be uncovered, we would gain an understanding of the basic nature of aging processes, which would, in turn, yield possible interventions in human aging. This book aims to provide the growing number of researchers in this field (faculty, postdoctoral trainees, and graduate students) with a detailed knowledge of what is known about caloric restriction within the frame of gerontology, as well as insights on future of this field.

**Advances in Immunity and Cancer Therapy** P. K. Ray,2012-12-06 The rapid and continuous upsurge of interesting data in the subject of tumor immunology necessitates the publication of an annual series to furnish the updated materials to the students, researchers, and clinicians in this

rapidly advancing field. Concepts and methodologies are ever changing. Also, current research in tumor immunology promises to offer breakthroughs in the future. Important is the need to communicate to the right people the exact role of immunodiagnostic methods and immunological intervention in cancer prevention and treatment. The role of immunotherapy in combination with conventional modalities of treatment needs to be understood in its proper perspective. Oncogene, interferon, lymphokines, monoclonal antibodies, natural killer cells, platelet-mediated cytotoxicity of antibody-coated target cells, suppressor cells, platelet-derived factors, plasma-blocking factors, control of suppressor cell function, abrogation of plasma-blocking factors, and so forth, are some of the areas that are continually advancing. Progress in these areas will have implication in cancer therapy. Further, it is already understood that if immunocompetence of the host can be maintained at a reasonably good level, there exists the potential to increase the therapeutic indexes of conventional modalities of treatment. This series will attempt to present updated information in all these areas based on contributed and solicited articles.

**Immunology of Clinical and Experimental Diabetes** Sudhir Gupta, 2013-11-11 During the past 5 years, impressive progress has been made in understanding the etiopathogenesis of experimental and clinical diabetes. The rapid progress that has been made in the general field of immunology has made possible new understanding regarding the role of the immune system in the pathogenesis of diabetes. The other two areas in which recent progress has been made in the field of diabetes include genetics and the role of infectious agent(s) in the etiopathogenesis of diabetes. Because of these recent developments, a vast amount of data has been accumulated and published in a number of metabolic, endocrine, immunological, and general medicine journals. The purpose of this book is to consolidate all the available information and present it in its current state. In the present volume, I strive to bring together relevant contributions from leaders in the fields of immunopathology, immunobiology, and genetics. The advancing understanding has in several instances reached the point of clinical application. This volume encompasses the entire scope of modern immunology of diabetes mellitus. This volume has been divided into two major parts, Experimental Diabetes and Clinical Diabetes. In the Experimental part are included chapters dealing with the structure and functions of insulin and the immune response to insulin. Spontaneous and experimentally induced models of type I diabetes mellitus are presented. The role of virus(es) in the etiology of experimental diabetes and the influence of sex on experimental diabetes are discussed. The transplantation of pancreas and islets is reviewed in detail.
