**Sampling Theory** Yonina C. Eldar,2015-04-09 Covering the fundamental mathematical underpinnings together with key principles and applications, this book provides a comprehensive guide to the theory and practice of sampling from an engineering perspective. Beginning with traditional ideas such as uniform sampling in shift-invariant spaces and working through to the more recent fields of compressed sensing and sub-Nyquist sampling, the key concepts are addressed in a unified and coherent way. Emphasis is given to applications in signal processing and communications, as well as hardware considerations, throughout. With 200 worked examples and over 200 end-of-chapter problems, this is an ideal course textbook for senior undergraduate and graduate students. It is also an invaluable reference or self-study guide for engineers and students across industry and academia.

*Mobile Displays* Achintya K. Bhowmik,Zili Li,Philip J. Bos,2008-07-31 The mobile display industry has witnessed rapid growth, in both volume and diversification, in recent years. This trend is expected to persist with continued consumer demand for mobile communications and computing applications. Mobile displays are now integral to a wide range of devices such as MP3 players, digital cameras, PDAs, GPS map readers, portable DVD players, and electronic books, as well as the ubiquitous mobile phone and laptop computers. This proliferation of products has fuelled a significant investment into the research and development of the mobile display, with key research laboratories across the display industry and academia producing many exciting technological advancements. With contributions from well-known experts, in both industry and academia, this book presents a comprehensive coverage of the mobile display in a single volume. Ranging from an in-depth analysis of the requirements that the

displays must meet, through current devices, to emerging technologies, the text features: mobile environment and human-factor considerations for the display; advances in the incumbent active matrix liquid crystal display (AMLCD) technologies; backlighting and light manipulation techniques; mobile display driver electronics and interface technologies; emerging technologies including active matrix organic light emitting diode (AMOLED), electronic paper displays, and system-on-glass (SOG) developments; application developments in eyewear, mobile projector, and 3D displays. Mobile Displays: Technology and Applications presents, in addition to the fundamentals, a detailed update on state-of-the-art advancements. It is an invaluable resource for practicing electronics and display engineers working on the development of mobile displays and their applications. It is also an extensive reference for graduates taking special courses in display technologies. The Society for Information Display (SID) is an international society, which has the aim of encouraging the development of all aspects of the field of information display. Complementary to the aims of the society, the Wiley-SID series is intended to explain the latest developments in information display technology at a professional level. The broad scope of the series addresses all facets of information displays from technical aspects through systems and prototypes to standards and ergonomics

**Rigidity in Dynamics and Geometry** Marc Burger, Alessandra Iozzi, 2013-03-09 This volume of proceedings is an offspring of the special semester Ergodic Theory, Geometric Rigidity and Number Theory which was held at the Isaac Newton Institute for Mathematical Sciences in Cambridge, UK,

from January until July, 2000. Beside the activities during the semester, there were workshops held in January, March and July, the first being of introductory nature with five short courses delivered over a week. Although the quality of the workshops was excellent throughout the semester, the idea of these proceedings came about during the March workshop, which is hence more prominently represented. The format of the volume has undergone many changes, but what has remained untouched is the enthusiasm of the contributors since the onset of the project: suffice it to say that even though only two months elapsed between the time we contacted the potential authors and the deadline to submit the papers, the deadline was respected in the vast majority of the cases. The scope of the papers is not completely uniform throughout the volume, although there are some points in common. We asked the authors to write papers keeping in mind the idea that they should be accessible to students. At the same time, we wanted the papers not to be a summary of results that appeared somewhere else.

**One-Dimensional Dynamics** Wellington de Melo, Sebastian van Strien, 2012-12-06 One-dimensional dynamics has developed in the last decades into a subject in its own right. Yet, many recent results are inaccessible and have never been brought together. For this reason, we have tried to give a unified account of the subject and complete proofs of many results. To show what results one might expect, the first chapter deals with the theory of circle diffeomorphisms. The remainder of the book is an attempt to develop the analogous theory in the non-invertible case, despite the intrinsic additional difficulties. In this way, we have tried to show that there is a unified theory in one-dimensional dynamics. By reading one or more of the chapters, the reader can quickly reach the frontier of research. Let us quickly summarize the book. The first chapter deals with circle diffeomorphisms and contains a complete proof of the theorem on the smooth linearizability of circle diffeomorphisms due to M. Herman, J.-C. Yoccoz and others. Chapter II treats the kneading theory of

Milnor and Thurston also included are an exposition on Hofbauer's tower construction and a result on fuB multimodal families (this last result solves a question posed by J. Milnor).

Numerical Integration of Stochastic Differential Equations G.N. Milstein, 2013-03-09 This book is devoted to mean-square and weak approximations of solutions of stochastic differential equations (SDE). These approximations represent two fundamental aspects in the contemporary theory of SDE. Firstly, the construction of numerical methods for such systems is important as the solutions provided serve as characteristics for a number of mathematical physics problems. Secondly, the employment of probability representations together with a Monte Carlo method allows us to reduce the solution of complex multidimensional problems of mathematical physics to the integration of stochastic equations. Along with a general theory of numerical integrations of such systems, both in the mean-square and the weak sense, a number of concrete and sufficiently constructive numerical schemes are considered. Various applications and particularly the approximate calculation of Wiener integrals are also dealt with. This book is of interest to graduate students in the mathematical, physical and engineering sciences, and to specialists whose work involves differential equations, mathematical physics, numerical mathematics, the theory of random processes, estimation and control theory.

**Identification of Dynamical Systems with Small Noise** Yury A. Kutoyants, 2012-12-06 Small noise is a good noise. In this work, we are interested in the problems of estimation theory concerned with observations of the diffusion-type process  $X_0 = X_0$ ,  $0 \sim t \sim T$ ,  $(0, 1)$  where  $W$  is a standard Wiener process and  $St(\cdot)$  is some nonanticipative smooth  $t$  function. By the observations  $X = \{X, 0 \sim t \sim T\}$  of this process, we will solve some  $t$  of the problems of identification, both parametric and nonparametric. If the trend  $S(-)$  is known up to the value of some finite-dimensional parameter  $St(X) =$

$St(\cdot, X)$ , where  $\{X\} \in \mathbb{R}^d$ , then we have a parametric case. The nonparametric problems arise if we know only the degree of smoothness of the function  $St(X)$ ,  $0 \leq t \leq T$  with respect to time  $t$ . It is supposed that the diffusion coefficient  $c$  is always known. In the parametric case, we describe the asymptotical properties of maximum likelihood (MLE), Bayes (BE) and minimum distance (MDE) estimators as  $c \rightarrow 0$  and in the nonparametric situation, we investigate some kernel-type estimators of unknown functions (say,  $St(0, 0 \leq t \leq T)$ ). The asymptotic in such problems of estimation for this scheme of observations was usually considered as  $T \rightarrow \infty$ , because this limit is a direct analog to the traditional limit ( $n \rightarrow \infty$ ) in the classical mathematical statistics of i. i. d. observations. The limit  $c \rightarrow 0$  in  $(0, 1)$  is interesting for the following reasons.
