**The Sea Cucumber *Apostichopus japonicus*** Hongsheng Yang, Jean-Francois Hamel, Annie Mercier, 2015-01-07 While sea cucumber is one of China's and Asia's most prized seafoods, and aquaculture programs are being developed on a huge commercial scale, Chinese expertise and knowledge in this area has not been well disseminated worldwide. The Sea Cucumber *Apostichopus japonicus* is the first book to bridge this gap by compiling key information related to hatchery and aquaculture techniques, nutritional and medical values, markets, and trade flow of the number one sea cucumber species. It summarizes the historical and most recent developments in the trade and aquaculture of *Apostichopus japonicus*, as well as important aspects of its anatomy, population dynamics, reproduction, development, physiology, and biochemistry. With sea cucumber harvest and aquaculture booming worldwide, comprehensive knowledge of China's technological breakthroughs in this rapidly expanding field is key. The Sea Cucumber *Apostichopus japonicus* is essential to understanding the cultural underpinnings of the insatiable market demands for sea cucumber and what drives sea cucumber trade. It also provides biological information and aquaculture techniques that can be adapted to other species, making it a valuable resource for researchers and practitioners involved in sea cucumber harvesting, aquaculture, and conservation. Explores the historical and current importance of *Apostichopus japonicus* in China, Japan, and the two Koreas Presents innovative production technologies in sea cucumber aquaculture Provides the latest scientific methods to maximize efficiency and production Includes important information on the design and operation of farms Discusses hot topics, current challenges, and future opportunities in aquaculture Highlights important advances in the study of sea cucumbers at the behavioral, cellular, and molecular levels

**Lotus japonicus Handbook** Antonio J. Márquez, J. Stougaard, M. Udvardi, M. Parniske, H. Späink, G. Saalbach, J. Webb, M. Chiurazzi, A. J. Márquez, 2006-01-27 Legumes are very important plants playing a central role in biological research. They are a key component of sustainable agricultural systems because of symbiotic nitrogen fixation and other beneficial symbiosis with mycorrhizal fungi. Studies on most of the major leguminous crops are hampered by large genome sizes and other disadvantages which have hindered the isolation and characterisation of genes with important roles in legume biology and agriculture. For this reason *Lotus japonicus* was chosen as a model species for legume research some ten years ago. Since then, many groups around the world have adopted *Lotus* as a model and have developed numerous resources and protocols to facilitate basic and applied research on this species. This handbook represents the first effort to compile basic descriptions and methods for research in *Lotus*, including symbiotic processes, cell and molecular biology protocols, functional genomics, mutants, gene tagging and genetic analysis, transformation and reverse genetic analysis, primary and secondary metabolism, and an exhaustive update of the scientific literature available on this plant.

**Synopsis of Biological Data on the Chub Mackerel (*Scomber japonicus* Houttuyn, 1782)** José J. Castro Hernández, Ana T. Santana Ortega, 2000 The chub or Spanish mackerel (*Scomber japonicus*) is a very important species in commercial and artisanal fisheries throughout the world. This synopsis brings together quantitative and qualitative information on various aspects of the mackerel's biology, ecology, stocks and utilisation, to improve knowledge of the species and help maintain it as an important food resource.

**The Lotus japonicus Genome** Satoshi Tabata, Jens Stougaard, 2014-09-26 This book provides insights into some of the key achievements made in the study of *Lotus japonicus* (birdsfoot trefoil), as well as a timely overview of topics that are pertinent for future developments in legume genomics. Key topics covered include endosymbiosis, development, hormone regulation, carbon/nitrogen and secondary metabolism, as well as advances made in high-throughput genomic and genetic approaches. Research focusing on model plants has underpinned the recent growth in plant genomics and genetics and provided a basis for investigations of major crop species. In the legume family Fabaceae, groundbreaking genetic and genomic research has established a significant body of knowledge on *Lotus japonicus*, which was adopted as a model species more than 20 years ago. The diverse nature of legumes means that such research has a wide potential and agricultural impact, for example, on the world's protein production.

Biology of the Japanese Common Sea Cucumber Stichopus Japonicus Selenka Choe Sang,1990 Up to 100 types of sea cucumber were known in the seas of Japan, of which 14 or 15 species were fished. Currently, only 3 edible species are produced, of which manamako is the most harvested. This report discusses the basic morphology, ecology and reproduction of red and green sea cucumbers. The report covers morphological and ecological differences between the two types, their taxonomy and distribution, the catch, habitat and environment, oxygen consumption rate, resistance in low salinity, food habits, seasonal changes, digestive enzymes, growth, regeneration, and tagging and crawling activity.
