**Australian Longhorn Beetles (Coleoptera: Cerambycidae) Volume 1** Adam Slipinski,Hermes Escalona,2013-09-20 Longhorn Beetles — Cerambycidae are one of the most easily recognised groups of beetles, a family that worldwide encompasses over 33,000 species in 5,200 genera. With over 1,400 species classified in 300 genera, this is the sixth largest among 117 beetle families in Australia. These beetles often attack and kill living forest or orchard trees and develop in construction timber (like European House borer, introduced to WA), causing serious damages. Virtually all Cerambycidae feed on living or dead plant tissues and play a significant role in all terrestrial environments where plants are found. Larvae often utilise damaged or dead trees for their development, and through feeding on rotten wood form an important element of the saproxylic fauna, speeding energy circulation in these habitats. Many species are listed as quarantine pests because of their destructive role to the timber industry. This volume provides a general introduction to the Australian Cerambycidae with sections on biology, phylogeny and morphology of adult and larvae, followed by the keys to the subfamilies and an overview of the 74 genera of the subfamily Lamiinae occurring in Australia. All Lamiinae genera are diagnosed, described and illustrated and an illustrated key to their identification is provided. A full listing of all included Australian species with synonymies and bibliographic citations is also included.

**Australian Longhorn Beetles (Coleoptera: Cerambycidae) Volume 3** Roger de Keyzer,Adam Slipinski,Mengjie Jin,2023-12-01 Longhorn beetles — Cerambycidae — are one of the most easily recognised groups of beetles, a cosmopolitan family that encompasses more than 33,000 species in 5,200 genera worldwide. Out of the 117 beetle families occurring in Australia, Cerambycidae is the sixth largest, comprising more than 1,400 species classified in 300 genera. Virtually all Cerambycidae feed on living or dead plant tissue and play a significant role in all terrestrial environments. Larvae often utilise damaged or dead trees for their development, and through feeding on rotten wood, form an important element of the saproxylic fauna, speeding nutrient and energy circulation in these habitats. Longhorn beetles can cause serious damage by sometimes feeding on and eventually killing living forest or orchard trees. Many species are listed as quarantine pests because of their destructive role to the timber industry, such as the European house borer introduced into Western Australia. This third volume in the series on Australian longhorn beetles extends to include the taxonomy of genera and species of the subfamily Prioninae of the Australo-Pacific Region. Seven tribes, 50 genera and 166 species are included. All genera and most species are diagnosed, described, illustrated and included in keys to their identification.

**Longhorned Woodboring Beetles (Coleoptera: Cerambycidae and Disteniidae)** Steven W. Lingafelter,Eugenio H. Nearn,Gérard L. Tavakilian,Miguel A. Monné,Michael Biondi,2014-09-02 In terms of quantity and breadth, the Smithsonian Institution's collection of longhorned woodboring beetles is one of the most important in the world. The effort to establish and describe this collection began as early as 1889, when the Smithsonian hired its first coleopterist (who was also only the second salaried entomologist at the Institution). In the years that followed, the collection grew thanks to the work of not only Smithsonian and U.S. Department of Agriculture entomologists, but also passionate amateur coleopterists who collected thousands of beetle specimens as they traveled the world for their professional occupations and then donated their unique collections to the Smithsonian. By 1957, the collection included nearly 200,000 specimens from around the world. Longhorned Woodboring Beetles (Coleoptera: Cerambycidae and Disteniidae): Primary Types of the Smithsonian Institution is the first complete catalog of Coleoptera primary types housed at the Smithsonian and includes stunning full-color images of each type specimen. The product of more than a decade of curatorial research and care, it reaffirms the superior international status of this truly remarkable collection.

A Field Guide of the Longhorned Beetles (Coleoptera, Cerambycidae) from Argentina Osvaldo R. Di Iorio,2005 The Argentinian fauna longhorn beetle fauna has about 850 species of which 720 are illustrated in this fine book, the first of its kind. Many species are shown in several specimens to illustrate the colour variation. Also, if male and female are different, both sexes are illustrated. All specimens

are shown in natural size. Many of the species covered by the book has a wider distribution in South America and occur in Paraguay, Uruguay, South Brazil, Chile and Bolivia. The book reports of 30 species new to the Argentinian fauna, as well as 4 species new to science. The book will be an important identification tool for both amateurs as well as professional entomologists. The author is the leading authority on Argentinian Cerambycidae.
