J. Sim Wallace

The Scientific Basis of Eating Roger W. A. Linden,1998 Eating is defined as the act of taking food into the mouth, chewing and then swallowing it for nourishment. The purpose of this volume is to present a number of up-to-date scientific reviews on the mechanisms involved in the process of eating and to introduce the reader to some of the problems encountered when these complex processes malfunction. Topics include a discussion on the peripheral mechanisms of taste and smell, taste and olfactory processing in the brain and its relation to the control of eating, and a section on mastication with an account of the scientific basis of masticatory disorders. The control mechanisms involved in salivation and swallowing are also extensively reviewed. Because this book reviews the fundamental understanding of the physiological mechanisms involved in eating and includes an insight into the scientific basis of the malfunction of these mechanisms, it will be of equal value to both clinical and basic scientists. In particular, basic and clinical oral biologists and neurophysiologists, dental and medical researchers and postgraduate students will find it a valuable source of information.

Neurobiology of Mastication Yoshio Nakamura,1999 Hardbound. Masticatory movements are characterized by rhythmicity and diversity of patterns of jaw, tongue and facial movements that vary depending on the species and the food ingested.In recent years the research field into the neural machinery of mastication has been greatly expanded to encompass a wider field of neuroscience, including a variety of biological and engineering disciplines. Thus, an international group of scientists who are actively involved in research of the neural mechanisms underlying motor, sensory and autonomic functions related to mastication gathered together in Tokyo, Japan to present a symposium on Neurobiology of Mastication.The primary purpose of the meeting was to provide in-depth review of our current understanding of the neural mechanisms controlling masticatory movements by integrating the recent progress in this research field from the molecular to systems approaches. The oral presentations reviewed recent advances

Understanding Masticatory Function in Unilateral Crossbites Maria Grazia Piacino,Stephanos Kyrkanides,2016-04-18 Unilateral posterior crossbite is a problem often seen in orthodontic practice, and properly understanding chewing patterns will lead to the most effective treatment program. Drawing on their research and available literature, Drs. Piacino and Kyrkanides present a fascinating look at chewing cycles and their role in the functional treatment of unilateral posterior crossbite. Describes the physiology and pathology of chewing patterns and muscular activation in humans Explains chewing patterns and muscular coordination, and their influence on the growth and harmony of the stomatognathic system Clinical instruction for checking and correcting masticatory function and functional asymmetry in order to prevent the relapse of the malocclusion Clinical cases walk readers through the treatment of seven crossbites

Mastication Robots Weilang Xu,John E. Bronlund,2010-07-29 Mastication Robotics: Biological Inspiration to Implementation is the first book in the special field of masticatory robots for applications including foods texture analysis, dental training and speech therapy. It is a collection of the efforts we have made in the field at Massey University, New Zealand. The book provides a thorough review of the human masticatory system, and presents principles, analysis, design, simulations and experiments of a number of masticatory robots developed by the authors. This book is a valuable reference for researchers, engineers and graduates in the field of robotics, mechatronics, automatic control, artificial intelligence and food sciences.

The Physiology of Mastication and Kindred Studies (Classic Reprint) J. Sim Wallace,2018-01-14 Excerpt from The Physiology of Mastication and Kindred Studies IN the following description of the act Of mastication taken from Huxley' 8 Elementary Physiology, there seems to be an incompleteness if not an error. It runs: When solid food is taken into the mouth it is cut and ground by the teeth, the fragments which ooze out upon the outer side of their crowns being pushed beneath them again by the muscular contractions of the cheeks and lips; while those that escape on the inner side are thrust back by the tongue, until the whole is thoroughly rubbed down. When the food is sufficiently ground, it is collected, enveloped in saliva, into a mass or bolus which rests upon the back of the tongue, and is carried backwards to the aperture which leads into the pharynx. It will be Observed that this description would lead one to think that the food is comminuted, mixed with saliva, and made into bolus form and then swallowed.
