Lateral-directional Aerodynamic Characteristics of Light, Twin-engine, Propeller-driven Airplanes Chester H. Wolowicz,Roxanah B. Yancey,1972 Analytical procedures and design data for predicting the lateral-directional static and dynamic stability and control characteristics of light, twin engine, propeller driven airplanes for propeller-off and power-on conditions are reported. Although the consideration of power effects is limited to twin engine airplanes, the propeller-off considerations are applicable to single engine airplanes as well. The procedures are applied to a twin engine, propeller driven, semi-low-wing airplane in the clean configuration through the linear lift range. The calculated derivative characteristics are compared with wind tunnel and flight data. Included in the calculated characteristics are the spiral mode, roll mode, and Dutch roll mode over the speed range of the airplane.

Wind Driven-propellers (or "Windmills") Max Michael Munk,1923 Wind-driven propellers are much used as sources of power for equipment such as radios. This report establishes the principles involved and acquaints the reader with rules for design of such windmills.

Large-scale Wind-tunnel Tests of a Propeller-driven Deflected Slipstream STOL Model in Ground Effect V. Robert Page,Thomas N. Aiken,1971

STOL Characteristics of a Propeller-driven, Aspect-ratio-10, Straight-wing Airplane with Boundary-layer Control Flaps, as Estimated from Large-scale Wind-tunnel Tests James A.

Weiberg,Curt A. Holzhauser,1961 Research presented relative to the take-off and landing distances possible with a conventional propeller-driven transport-type airplane indicated that if highly effective flaps were used in combination with large amounts of power to augment lift (STOL), the landing and take-off distances would be less than half of the distances for conventional operation. The study is based on the wind-tunnel tests of a model with BLC on the trailing-edge flaps and control surfaces. At the lowest speeds considered (about 50 knots), adequate longitudinal stability was obtained but the lateral and directional stability were unsatisfactory. At these low speeds the conventional aerodynamic control surfaces may not be able to cope with the forces and moments produced by symmetric as well as asymmetric engine power. This problem was alleviated by increasing control effectiveness by use of BLC. Further reductions in the landing and take-off speeds to obtain shorter distances probably will result in the need to supplement the aerodynamic controls, the need for counterrotating propellers, and possibly the need for interconnected shafting on the propellers.
