The American Railroad Passenger Car John H. White,1985 Hailed since its publication as the definitive - and most opulent - book on the subject, The American Railroad Passenger Car is now made available in an unabridged two-part softcover edition.

**Transit Rail** David J. Wise,2010-10 Rail transit offers society a number of benefits, including reduced congestion and pollution and increased mobility. However, rail systems and cars are costly: Transit agencies can pay more than \$3 million per car, often using federal funds. This report describes: (1) characteristics of the U.S. market for transit rail cars; (2) the federal government's role in funding and setting standards for transit rail cars; and (3) challenges transit agencies face when procuring rail cars. The report analyzed U.S. and worldwide rail car market data for commuter, heavy, and light rail systems and interviewed Department of Transportation officials and domestic and international industry stakeholders, including the American Public Transportation Assoc. Charts and tables.

**Trains and Technology: Cars** Anthony J. Bianculli,2001 Volume 2 of 'Trains and Technology' is devoted to railroad cars of nineteenth-century America. Since the variety of cars used during the nineteenth century was huge, the book is divided into three sections- passenger, freight, and non-revenue cars. The easily understood, jargon-free discussions and explanations throughout the book are accompanied by over 225 illustrations and accurate scale drawings of the various equipment.

*Mansions on Rails* Lucius Beebe,1959 Private Pullmans were once the hallmark of affluence and social success.

*The Electric Pullman* Lawrence A. Brough,2013-04-18 A history of the Ohio railroad car and equipment company and its 16-year run. Entering an already crowded and established industry, the Niles Car & Manufacturing Company in Ohio began business with surprising success, producing well over 1,000 electric and steam railway cars—cars so durable they rarely needed to be replaced. That durability essentially put the company out of business, and it vanished from the scene as quickly as it had appeared, leaving little behind except its sturdy railway cars. The story of this highly regarded company spans just 16 years, from Niles's incorporation in 1901 to the abandonment of railway car production and sale of the property to a firm that would briefly build engine parts during World War I. Including unpublished photographs and rosters of railway cars produced by the company and still in existence in railroad museums, *The Electric Pullman* will appeal to railroad enthusiasts everywhere. Praise for *The Electric Pullman* "Required reading for anyone interested in interurban history. It holds additional appeal for those interested in Ohio history or the junction point between business, society, and technology." —*Lexington Quarterly* "Although not one of the major manufacturers in its field, the Niles company produced some notable and well-remembered equipment during the height of the electric interurban railway era. Indeed, among some interurban railway historians, Niles cars are sacred objects. As such, its story deserves to be told and theoretically would be a logical complement to IUP's books on the Brill and Jewett companies. Brough himself is a serious historian who knows his subject and has clearly mined all the sources that seem to exist." —Herbert H. Harwood, Jr., author of *The Railroad that Never Was* and *The New York, Westchester & Boston Railway*

**Dynamic Responses of Railroad Car Models to Vertical and Lateral Rail Inputs** John L.

Sewall,Russell V. Parrish,Barbara J. Durling,1971 Simplified dynamic models were applied in a study of vibration in a high-speed railroad car. The mathematical models used were a four-degree-of-freedom model for vertical responses to vertical rail inputs and a ten-degree-of-freedom model for lateral response to lateral or rolling (cross-level) inputs from the rails. Elastic properties of the passenger car body were represented by bending and torsion of a uniform beam. Rail-to-car (truck) suspensions were modeled as spring-mass-dashpot oscillators. Lateral spring nonlinearities approximating certain complicated truck mechanisms were introduced. The models were excited by displacement and, in some cases, velocity inputs from the rails by both deterministic (including sinusoidal) and random input functions. Results were obtained both in the frequency and time domains. Solutions in the time domain for the lateral model were obtained for a wide variety of transient and random inputs generated on-line by an analog computer. Variations in one of the damping properties of the lateral car suspension gave large fluctuations in response over a range of car speeds for a given input. This damping coefficient was significant in reducing lateral car responses that were higher for nonlinear springs for three different inputs.

New Haven Streetcars ,2003 The first street railway began operating in New York City in 1832. New Orleans inaugurated a street railway system in 1835, and most of the large American cities- Boston, Brooklyn, and Baltimore-were served by the end of the 1950s. In May 1861, more than a year before the nation's capital introduced this new mode of transit, the forty thousand residents of New Haven were furnished with local rail transportation. New Haven's population more than quadrupled between 1861 and 1948, and the city became Connecticut's largest manufacturing center. Street railways made it possible to reach both residential and manufacturing areas. New Haven Streetcars illustrates the essential role played by streetcars in the transformation of the city, with images from each of the six groups of lines that served the New Haven area, including the Yale Bowl open cars, the universal dump cars, the safety cars, and the horse-drawn cars.
