Marketing to the Social Web Larry Weber,2009-03-03 An updated and expanded Second Edition of the popular guide to social media for the business community Marketers must look to the Web for new ways of finding customers and communicating with them, rather than at them. From Facebook and YouTube to blogs and Twitter-ing, social media on the Internet is the most promising new way to reach customers. Marketing to the Social Web, Second Edition helps marketers and their companies understand how to engage customers, build customer communities, and maximize profits in a time of marketing confusion. Author and social media guru Larry Weber describes newly available tools and platforms, and shows you how to apply them to see immediate results and growth. Rather than broadcast messages to audiences, savvy marketers should encourage participation in social networks to which people want to belong, where dialogue with customers, and between customers, can flourish. in Networking sites like MySpace, Facebook, and even Flickr are the perfect forums for this dialog; this book shows you how to tap into this new media. In addition to the tools and tactics that made Marketing to the Social Web a critical hit among marketers, this second edition includes three entirely new chapters that cover recent changes in the field. These new chapters describe how Facebook will monetize its business and one day surpass Google; how companies can measure the influence and effectiveness of their social media campaigns; and how marketing to mobile social media will grow into an effective practice in the near future. Marketing must reach out into new forms, media, and models. Marketing to the Social Web, Second Edition presents an exceptional opportunity to use these new tools and models to reach new markets, even in today's fragmented media environment. Larry Weber has spent the last three decades building global communications companies, including Weber Shandwick Worldwide and the W2 Group. He is also the founder and Chairman of the Massachusetts Innovation and Technology Exchange, the nation's largest interactive advocate association.

How to Drift Paul Morton,2006 Drifting is the newest, most exciting motorsport we have seen in the United States since the invention of the limited slip differential - it may be the most exhilarating contest of man and machine ever devised! From the winding mountain passes and desolate industrial roads of Japan, this unique sport of sliding a car sideways through a series of corners has become a huge hit in America. Drifting, or dorifto as they call it in Japan, extracts the most exciting aspect auto racing, extreme oversteer, and makes it the focus of an intense and visually intoxicating new motor sport. How to Drift: The Art of Oversteer is a comprehensive guide to both the driving technique and car setup required for drifting. The author defines various precision driving techniques used in drifting and explains them from a racecar driver's point of view. How to Drift illustrates the finer elements of car control required in drifting with technical descriptions, detailed line art and intense photography. This book even includes a budget drift car build-up with detailed suspension, chassis, and engine modifications that will help you turn your economy car into a drift machine— on top of that, there's a chapter detailing the finer aspects of an SR20DET swap!

Conformal Blocks, Generalized Theta Functions and the Verlinde Formula Shrawan Kumar,2021-11-30 In 1988, E. Verlinde gave a remarkable conjectural formula for the dimension of conformal blocks over a smooth curve in terms of representations of affine Lie algebras. Verlinde's formula arose from physical considerations, but it attracted further attention from mathematicians when it was realized that the space of conformal blocks admits an interpretation as the space of generalized theta functions. A proof followed through the work of many mathematicians in the 1990s. This book gives

an authoritative treatment of all aspects of this theory. It presents a complete proof of the Verlinde formula and full details of the connection with generalized theta functions, including the construction of the relevant moduli spaces and stacks of G-bundles. Featuring numerous exercises of varying difficulty, guides to the wider literature and short appendices on essential concepts, it will be of interest to senior graduate students and researchers in geometry, representation theory and theoretical physics.

Meta-informative Centering in Utterances André Włodarczyk,Hélène Włodarczyk,2013-12-15 The notion of information has nowadays become crucial both in our daily life and in many branches of science and technology. In language studies, this notion was used as a technical term for the first time about at least fifty years ago. It is argued, however, that Old and New, used traditionally for characterising information, refer in fact to the meta-informative status of communicated chunks of information. They provide information about other information. Since subjects and objects, as attention-driven phrases, are also related to aboutness, the presented Meta-Informative Centering (MIC) framework includes predication theory. By applying the MIC theory to their analyses of English, German, French, Polish, Russian, Greek, Latin, and Japanese, the authors provide comprehensive explanations of the most puzzling aspects of the pragmatic use of basic universal linguistic categories. It seems clear now that canonical syntactic patterns, their permutations, and diverse transformations do indeed reflect very truly the meta-informative encapsulation of utterances. As a consequence, this book presents new and coherent theoretical solutions as well as their very efficient applications.

Algebraic Invariants of Links Jonathan Arthur Hillman,2012 This book serves as a reference on links and on the invariants derived via algebraic topology from covering spaces of link exteriors. It emphasizes the features of the multicomponent case not normally considered by knot-theorists, such as longitudes, the homological complexity of many-variable Laurent polynomial rings, the fact that links are not usually boundary links, free coverings of homology boundary links, the lower central series as a source of invariants, nilpotent completion and algebraic closure of the link group, and disc links. Invariants of the types considered here play an essential role in many applications of knot theory to other areas of topology. This second edition introduces two new chapters twisted polynomial invariants and singularities of plane curves. Each replaces brief sketches in the first edition. Chapter 2 has been reorganized, and new material has been added to four other chapters.
