Transport Phenomena R. Byron Bird, Warren E. Stewart, Edwin N. Lightfoot, 2006-12-11 Transport Phenomena has been revised to include deeper and more extensive coverage of heat transfer, enlarged discussion of dimensional analysis, a new chapter on flow of polymers, systematic discussions of convective momentum, and energy. Topics also include mass transport, momentum transport and energy transport, which are presented at three different scales: molecular, microscopic and macroscopic. If this is your first look at Transport Phenomena you'll quickly learn that its balanced introduction to the subject of transport phenomena is the foundation of its long-standing success.

Radiation in a Cloudy Atmosphere E.M. Feigelson, 1984-07-31 Radiative heat transfer is a fundamental factor in the energetics of the terrestrial atmosphere: the system consisting of the atmosphere and the underlying layer is heated by the Sun, and this heating is compensated, on the average, by thermal radiation. Only over a period of 1-3 days from some specified initial moment can the dynamic processes in the atmosphere be considered to be adiabatic. Global dynamic processes of long duration are regulated by the actual influxes of heat, one of the main ones being the radiative influx. Radiation must be taken into account in long-term, weather forecasting and when considering the global circulation of the atmosphere, the theory of climate, etc. Thus it is necessary to know the albedo of the system, the amount of solar radiation transmitted by the atmosphere, the absorptivity of the atmosphere vis-a-vis solar radiation, and also the effective radiation flux, the divergence of which represents the radiative cooling or heating. All these quantities have to be integrated over the wavelength spectrum of the solar or thermal radiation, and they must be ascertained as functions of the determining factors. The relationships between the indicated radiation characteristics, the optical quantities directly determining them, the optically active components of the atmosphere, and the meteorological fields will be discussed in this book.

Alloy Phase Stability G.M. Stocks, A. Gonis, 2012-12-06 One of the ultimate goals of materials research is to develop a fundamental and predictive understanding of the physical and metallurgical properties of metals and alloys. Such an understanding can then be used in the design of materials having novel properties or combinations of properties designed to meet specific engineering applications. The development of new and useful alloy systems and the elucidation of their properties are the domain of metallurgy. Traditionally, the search for new alloy systems has been conducted largely on a trial and error basis, guided by the skill and intuition of the metallurgist, large volumes of experimental data, the principles of 19th century thermodynamics and ad hoc semi-phenomenological models. Recently, the situation has begun to change. For the first time, it is possible to understand the underlying mechanisms that control the formation of alloys and determine their properties. Today theory can begin to offer guidance in predicting the properties of alloys and in developing new alloy systems. Historically, attempts directed toward understanding phase stability and phase transitions have proceeded along distinct and seemingly diverse lines. Roughly, we can divide these approaches into the following broad categories. 1. Experimental determination of phase diagrams and related properties, 2. Thermodynamic/statistical mechanical approaches based on semi phenomenological models, and 3. Ab initio quantum mechanical methods. Metallurgists have traditionally concentrated their efforts in categories 1 and 2, while theoretical physicists have been preoccupied with 2 and 3.

Parmenides' Grand Deduction Michael V. Wedin, 2014-10-16 Michael V. Wedin presents a new interpretation of Parmenides' Way of Truth: the most important philosophical treatise before the work of Plato and Aristotle. The Way of Truth contains the first extended philosophical argument in the western tradition—an argument which decrees that there can be no motion, change, growth, coming to be, or destruction; and indeed that there can be only one thing. These severe metaphysical theses are established by a series of deductions and these deductions in turn rest on an even more fundamental claim, namely, the claim that it is impossible that there be something that is not. This claim is itself established by a deduction that Wedin calls the Governing Deduction. Wedin offers a rigorous reconstruction of the Governing Deduction and shows how it is used in the arguments that establish Parmenides' severe metaphysical theses (what Wedin calls the Corollaries of the Governing Deduction). He also provides successful answers to most commentators who find Parmenides' arguments to be shot through with logical fallacies. Finally, Wedin turns to what is currently the fashionable reading of Parmenides, according to which he falls squarely in the tradition of the Ionian natural philosophers. He argues that the arguments for the Ionian Interpretation fail badly. Thus, we must simply determine where Parmenides' argument runs, and here there is no substitute for rigorous logical reconstruction. On this count, as our reconstructions make clear, the argument of the Way of Truth leads to a Parmenides who is indeed a severe arbiter of philosophical discourse and who brings to a precipitous halt the entire enterprise of natural explanation in the Ionian tradition.

Soft Computing and Industry Rajkumar Roy, 2002 Soft computing embraces various methodologies for the development of intelligent systems that have been successfully applied to a large number of real-world problems. This text contains a collection of papers that were presented at the 6th On-line World Conference on Soft Computing in Industrial Applications that was held in September 2001. It provides a comprehensive overview of recent theoretical developments in soft computing as well as of successful industrial applications. It is divided into seven parts covering material on: keynote papers on various subjects ranging from computing with autopoietic systems to the effects of the Internet on education intelligent control classification, clustering and optimization image and signal processing agents, multimedia and Internet theoretical advances prediction, design and diagnosis. The book is aimed at researchers and professional engineers who develop and apply intelligent systems in computer engineering.

Sustainable Catalysis Michael North, 2015-11-16 Catalysis is a fundamentally sustainable process which can be used to produce a wide range of chemicals and their intermediates. Focussing on those catalytic processes which offer the most sustainability, this two-part book explores recent developments in this field, as

well as examining future challenges. Focussing on catalysis through non-endangered metals, chapters are dedicated to the most important sustainable metals in catalysis: titanium, iron and aluminium. Remaining chapters examine several other important metals. Green aspects of the various reactions are also discussed, such as atom economy and use of green solvents and other reaction conditions. Together with “Sustainable Catalysis: Without Metals or Other Endangered Elements”, these books examine the progress in sustainable catalysis in all areas of chemistry, and are an important reference for researchers working in catalysis and green chemistry.

Theory, Methodology, Tools and Applications for Modeling and Simulation of Complex Systems Lin Zhang,Xiao Song,Yunjie Wu,2016-09-21 This four-volume set (CCIS 643, 644, 645, 646) constitutes the refereed proceedings of the 16th Asia Simulation Conference and the First Autumn Simulation Multi-Conference, AsiaSim / SCS AutumnSim 2016, held in Beijing, China, in October 2016. The 265 revised full papers presented were carefully reviewed and selected from 651 submissions. The papers in this second volume of the set are organized in topical sections on HMI and robot simulations; modeling and simulation for intelligent manufacturing; military simulation; visualization and virtual reality.

Correlation of Two Fracture Toughness Tests for Titanium and Ferrous Alloys Charles N. Freed,1969 High-strength ferrous and titanium alloys are of interest for use in complex structures; a knowledge of the notch fracture toughness of these alloys is necessary to preclude catastrophic failure. A previously established relationship between the dynamic tear test energy and the explosion tear test performance provides reliable fracture-toughness information of those alloys characterized by a toughness level requiring plastic deformation to propagate fracture. This analysis has not been extended to the ultrahigh-strength alloys in which fracture can propagate castastrophically at elastic stress levels. For these alloys, the analytical methods of linear elastic fracture mechanics provide the required elastic stress level and flaw-size relationship for fracture. This report deals with a 'marriage' of the two approaches-the engineering and the analytical-by correlative techniques. (Author).
