<https://www.chinesestandard.net>,2023-11-11 This Standard specifies the measurement principle, instrument requirements, test conditions, test procedures, and test report of the closed gas loop circulation method for measuring hydrogen content in liquid aluminum and aluminum alloys. This Standard applies to the determination of hydrogen content in liquid aluminum and aluminum alloys. 2 Measurement principle The closed gas loop circulation method uses a circulation system to promote the diffusion of hydrogen in the aluminum melt into a quantitative volume of inert gas, until the hydrogen partial pressure reaches equilibrium. It uses the thermal conductivity test principle to test the change in thermal conductivity of circulating gas due to hydrogen, and measure the partial pressure of hydrogen P_i . The calculation method of hydrogen content is as shown in formula (1): where: $[H]$ - the hydrogen content, in cubic centimeter per 100 grams of aluminum ($\text{cm}^3/100 \text{ g Al}$); P_i - the hydrogen partial pressure, in kilopascal (kPa); K - the alloy correction coefficient, determined by referring to formula (2). The correction coefficient K of commonly used aluminum and aluminum alloys is shown in Table 1; S_0 - the solubility of hydrogen in pure aluminum, which is a function of temperature, as shown in formula (3), in cubic centimeter per 100 grams of aluminum ($\text{cm}^3/100 \text{ g Al}$). Concurrency in Dependable Computing Paul Ezhilchelvan,Alexander Romanovsky,2013-03-14

Concurrency in Dependable Computing focuses on concurrency related issues in the area of dependable computing. Failures of system components, be hardware units or software modules, can be viewed as undesirable events occurring concurrently with a set of normal system events. Achieving dependability therefore is closely related to, and also benefits from, concurrency theory and formalisms. This beneficial relationship appears to manifest into three strands of work. Application level structuring of concurrent activities. Concepts such as atomic actions, conversations, exception handling, view synchrony, etc., are useful in structuring concurrent activities so as to facilitate attempts at coping with the effects of component failures. Replication induced concurrency management. Replication is a widely used technique for achieving reliability. Replica management essentially involves ensuring that replicas perceive concurrent events identically. Application of concurrency formalisms for dependability assurance. Fault-tolerant algorithms are harder to verify than their fault-free counterparts due to the fact that the impact of component faults at each state need to be considered in addition to valid state transitions. CSP, Petri nets, CCS are useful tools to specify and verify fault-tolerant designs and protocols. Concurrency in Dependable

Computing explores many significant issues in all three strands. To this end, it is composed as a collection of papers written by authors well-known in their respective areas of research. To ensure quality, the papers are reviewed by a panel of at least three experts in the relevant area.

Theoretical Chemistry Advances and Perspectives Henry Eyring,2012-12-02 Theoretical Chemistry: Advances and Perspectives, Volume 3 compiles studies that review all aspects of theoretical chemistry. This book begins by discussing the developments which have made the ab initio investigation of molecular ions feasible, followed by a treatment on classical equilibrium thermodynamics. The significant structure theory of liquids, structure of fluid ^4He by means of zero and nonzero temperatures, and radial distribution function are also considered. This volume concludes with a description on various types of proton transfer

reactions in water, explaining how the great speed of such reactions are intimately associated with the unusual hydrogen-bond structure that characterizes liquid water. This publication is valuable to theoretical chemists and students concerned with the mathematical description of chemistry.

Control Problems in Industry Irene Lasiecka, Blaise Morton, 2013-03-11 This volume contains a collection of papers presented at the Symposium on Control Problems in Industry, held on July 22-23, 1994 in San Diego. The Symposium, conducted by the Society for Industrial and Applied Mathematics (SIAM), with the cooperation of the Institut National Recherche Informatique et Automatique (INRIA), focused on

industrial control applications that have benefited from recent mathematical and technological developments. A partial list of themes featured by the Symposium is listed below. 1) Applications of Control Techniques in a) the aerospace industry, b) the automotive industry, c) the environmental science, d) manufacturing processes, e) the petroleum industry. 2) Optimal Shape Design in Aerospace Applications 3) Optimal Design of Micro-optics 4) Robust Control and H-infinity Methods The purpose of this meeting was to bring together experts from industry and academia to share their experience and present new results and new trends in modern control theory, with a focus on real industrial applications. The presentations were selected primarily for the practical significance of the problem solved, though all had significant mathematical components. Control theory is an interdisciplinary field which, in its broadest sense, encompasses contributions ranging from classical engineering disciplines (circuit theory, automata theory, electronics, manufacturing, mechanical engineering, material science), to theoretical engineering (system theory, computer science) and various areas of mathematics such as ODE, PDE, complex analysis, function theory, algebraic and differential geometry, numerical analysis, etc.
