**American Military Training Aircraft** E.R. Johnson,Lloyd S. Jones,2015-02-12 The U.S. did not become the world's foremost military air power by accident. The learning curve—World War I, World War II, the Korean War, the Vietnam War, the Gulf War, and more recently the war on terror—has been steep. While climbing this curve, the U.S. has not only produced superior military aircraft in greater numbers than its foes, but has—in due course—out-trained them, too. This book provides a comprehensive historical survey of U.S. military training aircraft, including technical specifications, drawings and photographs of each type of fixed and rotary-wing design used over a 98-year period to accomplish the first step of the learning process: the training of pilots and aircrews.

*Air Force and Navy Plans to Acquire Trainer Aircraft* United States. General Accounting Office,1981

*Training the Right Stuff* Mark A. Frankel,Tommy H. Thomason,2016-08-28 This is a comprehensive study of the training aircraft used to transition the United States military into the jet age. After assembling the greatest air armada in history in World War II, the United States faced the challenges of the Cold War. High-performance jets replaced propeller fighters, and a new generation of pilots was needed. But military planners, reluctant to scrap the existing inventory of trainers, insisted these pilots earn their wings in airplanes designed in the 1930s. The attrition rate among newly winged pilots, assigned to jets that often exceeded their abilities, was appalling. Finally, in 1949, a privately funded jet trainer, the T-33 was developed, followed by the T-28 in 1950, the T-34 in 1953, and T-37 in 1957. Gradually, pilot proficiency improved, but the cycle is recurring as new trainers and teaching techniques are needed to replace the aging aircraft and methods of the past.--Jacket.

**Device-task Fidelity and Transfer of Training** Wallace W. Prophet,H. Alton Boyd,1970 The objective of the research was to evaluate the training effectiveness of two cockpit procedures training devices, differing greatly in their physical fidelity (and, consequently, cost), in the teaching of ground cockpit procedures for a twin-engine, turboprop, fixed wing aircraft. One group of students received training in cockpit procedures in a relatively expensive, sophisticated, high-fidelity, computerized cockpit procedures trainer, while another group were trained in an inexpensive, low-fidelity mockup of the aircraft cockpit. Their subsequent performance in the actual aircraft was compared with that of a control group who received all of their procedures training in the aircraft. Results indicated that both training devices produced significant transfer of training, in terms of error and time reduction, in performance in the actual aircraft. There were no significant differences in training effectiveness of the two devices, in spite of their great differences in physical fidelity and cost. Implications for the design of procedures training devices and associated training programs are discussed. (Author).

**Training Planes of World War II** Nancy Robinson Masters,1998 Introduces the various kinds of World War Two trainer planes, describes the missions for which they were used, and sketches the training required of their pilots. Also discusses what some of the airplanes were used for after World War 2.

*Assessing the Impact of Future Operations on Trainer Aircraft Requirements* ,2005 This monograph examines how the skills needed to perform future military missions might affect the capabilities required of new pilot training systems. In the next few years, the Air Force must decide to replace or extend the lives of two of its trainer aircraft. This monograph addresses which skills should be taught in undergraduate flying training, which are so different that they cannot be taught in current training aircraft, and what impact these issues have on decisions to replace or extend the lives of the aircraft.

*Flight Training Handbook* United States. Flight Standards Service,1980 The materials contained in this handbook include the skills and knowledges considered necessary to satisfy the pilot's basic needs to effectively operate present-day general aviation airplanes, and conform to the pilot's training and certification concepts established by Federal Aviation Regulations, Part 61. (from preface).

The U.S. Army purchased its first airplane, built andsuccessfully flown by Orville and Wilbur Wright, in 1909, and placed bothlighter- and heavier-than-air aeronautics in the Division of Military Aeronauticsof the Signal Corps. Luftwaffe Training Aircraft Chris Goss,2019-09-30 From a retired RAF Wing Commander, an introductory guide to the aerial warfare training methods implemented by Germany for airmen during World War II. The often-unnoticed element in aerial warfare is the training, yet its value is beyond calculation. The Luftwaffe used a variety of aircraft in this fundamental role, with trainee pilots progressing from simpler, older machines to the more sophisticated, as well as heavier aircraft. Gradually airmen were introduced to newer, faster models that enabled them to experience, to some degree, the type of aircraft they would fly in combat. Recruits would initially spend six months at a Fliegerersatzabteilung or training depot, where the main emphasis was on drill and physical training, with introductory lectures on the principles of wireless operation and map reading. This would be followed by two months studying general aeronautical subjects, before being sent to elementary flying school. The various kinds of aircraft used for training depended upon the role each individual trainee would eventually undertake, from single-seat fighters to multiple-crew bombers or transports. In this, the Luftwaffe was also able to make use of captured enemy aircraft. It also established training units through the Occupied territories to enable its trainees to familiarize themselves with different conditions and terrain. In the less-pressurized environment of the training schools away from the front line, more care could be taken over photography, resulting in the author of this extensive study of the wide range of aircraft used for training by the Luftwaffe, being able to assemble such a fine collection of excellent images.

**Scenario-Based Training with X-Plane and Microsoft Flight Simulator** Bruce Williams,2011-12-28 Fly toward pilot certification with these real-world scenario exercises Although PC-based flight simulations have been available for 30 years, many pilots, instructors, and flight schools don't understand how best to use these tools in real-world flight training and pilot proficiency programs. This invaluable reference bridges the gap between simulation tools and real-world situations by presenting hands-on, scenario-based exercises and training tips for the private pilot certificate and instrument rating. As the first of its kind based on FAA-Industry Training Standards (FITS), this book steers its focus on a scenario-based curriculum that emphasizes real-world situations. Experienced pilot and author Bruce Williams ultimately aims to engage the pilot, reinforce the realistic selling point of PC-based flight simulations, while also complementing the FAA-approved FITS syllabi. Serves as essential reading for pilots who want to make effective use of simulation in their training while expanding their skill level and enjoyment of flying Covers private pilot real-world scenarios and instrument rating scenarios Includes a guide to recommended websites and other resources Features helpful charts as well as a glossary You'll take off towards pilot certification with this invaluable book by your side.
