Alan Vick

An Illustrated Guide to Modern Airborne Missiles
Bill Gunston, 1983 Oversigt over flybevæbning - her i form af missiler (Air-to-Air, Air-to-Surface og Anti-tank-Missiles).

Aerospace Operations Against Elusive Ground Targets Alan Vick, 2001 In response to air power's growing ability to detect and defeat large ground forces in the open, enemy forces are becoming increasingly elusive, operating in smaller formations and using civilian motor traffic, built-up areas, and woods to hide their forces and activities. To help the United States Air Force (USAF) better understand and prepare for a world in which such targets predominate, this book seeks to identify concepts and technologies that could improve the USAF's capability to detect, classify, recognize, and defeat elusive targets, whether dispersed ground forces or mobile ballistic missiles. Emphasized is an integrated system of technologies, focused analysis, and streamlined control procedures that will enable the detect-classify-recognize-defeat cycle to occur in minutes rather than hours or days. Although new technologies (e.g., improved sensors, small unmanned aerial vehicles, hypersonic weapons, automatic target recognition software) are necessary, they alone cannot solve this problem. Rather, it is the combination of pre-battle analysis, new technologies, and streamlined control that offers the potential to dramatically improve U.S. capabilities against elusive targets. This book presents engagement concepts that bring together finders (assets required to identify and

track enemy forces, as well as civilians who might be put at risk); controllers (who direct the actions of finders and strike aircraft, select worthwhile targets, and make decisions to engage); and strike assets (ground-to-ground or air-to-ground weapons used to attack the targets). Each concept for detecting and defeating elusive maneuver forces and mobile missiles focuses on attacking enemy vehicles rather than personnel to capitalize on unique signatures that can be detected by clusters of, for example, acoustic, seismic, and imaging sensors, or an integrated system of synthetic aperture, inverse synthetic aperture, and ground moving-target indicator radars. This book should be of interest to airmen serving in plans, operational, analytic, and R & D organizations, as well as the broader defense community.

Air Launch! William G. Holder, Bill Holder, 2001
This book examines the history of airborne-launched weapons and a number of variations. Each weapon is given a brief developmental description and a summary of who has implemented it, and includes cross references to other countries' similar platforms. A wide range of many never before published photos offers a striking view of the history and the proposed future of these arsenals.

Weaponneering Morris R. Driels, 2004 This is the first comprehensive text to describe and quantify the methods commonly used to predict the probability of successfully attacking ground targets using air-launched or ground-launched weapons. Air-launched weapons include guided and unguided bombs, air-to-ground missiles, laser-guided bombs, rockets, and guns. Surface engagements cover both direct and indirect fire weapons. The text outlines the various methodologies used in operational products used widely in the U.S. Army, Navy, Air Force, and Marine Corps. It explains the underlying methodologies for the key munitions effectiveness tools, Joint Air-to-Surface Weaponneering Systems (JAWS), and JMEM/SS Weapons Effectiveness Systems.

Application of the JANUS Combat Model for Analysis of Alternatives John M. Vannoy, 2002-06-01

By 2010, 100 percent of the existing stockpile of Hellfire and TOW 2A/2B missiles will reach their design shelf life. The stock of Hellfire missiles available to support Army air-to-ground combat will be depleted by 2015. Of particular interest to the Aviation community is the Comanche first unit equipped (FUE) in 2009, which will be significantly impacted by the scarcity and condition of this primary weapon. This research employs the Janus Combat Model in a Simulation Based Acquisition (SBA) approach to an Analysis of Alternatives (AOA) in an effort to find a replacement for these legacy missiles. Janus will be utilized to analyze the military worth of a newly proposed missile named the Common Missile (CM) as compared to its primary aviation employed alternative, the Hellfire Missile (HB) . This analysis utilizes an Army Aviation Deep Attack scenario developed within the Janus Combat Model for this evaluation. The objective of this research is to investigate which missile is the best operational alternative for Army Aviation and to determine to what extent it is better. For this research operational effectiveness will be evaluated statistically by analyzing the systems' contributions to platform key measures of effectiveness such as lethality, survivability, and engagement. Additionally, an operational analysis is performed from the warfighter's perspective examining resource requirements and fundamental tactical employment differences between the CM and HB.

**Unitary Joint Standoff Captive Air Training
Missile Avionics Design Through Operational**

Concepts and Functional Requirements Analysis

Dennis J. Reilly, 1996-03-01 To accurately simulate the Unitary Joint Standoff (JSOW) weapon functions and provide pilots with the most realistic training, the captive air training missile (CATM) avionics design will fully implement well defined operational concepts and functional requirements in terms of flight simulation characteristics, operational functions, pilot feedback, and electronic interfaces. This would provide the Navy, Marines, and Air Force with a single, multi-capable, light weight CATM that consolidates CATM procurement, decreases aircraft turnaround time and increases aircrew training per flight hour.

Achtung-Panzer! Heinz Guderian, 1995 This is one of the most significant military books of the twentieth century. By an outstanding soldier of independent mind, it pushed forward the evolution of land warfare and was directly responsible for German armoured supremacy in the early years of the Second World War. Published in 1937, the result of 15 years of careful study since his days on the German General Staff in the First World War, Guderian's book argued, quite clearly, how vital the proper use of tanks and supporting armoured vehicles would be in the conduct of a future war. When that war came, just two years later, he proved it, leading his Panzers with distinction in the Polish, French and Russian campaigns. Panzer warfare had come of age, exactly as he had forecast. This first English translation of Heinz Guderian's classic book - used as a textbook by Panzer officers in the war - has an

introduction and extensive background notes by the modern English historian Paul Harris.
