*From Clone to Clinic* Daan J.A. Crommelin, H. Schellekens, 2012-12-06 This  
book contains a selection of the papers presented at the meeting Between  
Clone and Clinic which was organised in March 1990 in Amsterdam by the Dutch  
Organisation for Applied Research, TNO, and the University of Utrecht. The  
scope of this meeting was the development of biotechnological pharmaceuticals  
mainly made by recombinant DNA technology or monoclonal antibody techniques.  
All aspects concerning the development of the products after host cells  
producing them are obtained where discussed. The meeting was attended by  
two hundred specialists from all over the globe, including pharmacologists,  
toxicologists, registration experts, Quality Assurance managers, production  
engineers and physicians. Biotechnological pharmaceuticals are in general

large and complex protein molecules. Bringing these products to the market poses other problems than encountered with the classical chemical drugs. The source of biotechnological pharmaceuticals are living cells. The function of cells are depend ent on many factors and the stability of production may be a problem. Good Laboratory and Manufactory Practices with Quality Control (GLP and GMP) are of paramount importance and are discussed in a number of papers. The products of the new biotechnology are often highly specific and only active in the human species. Also the side effects can only be studied in the clinical setting. Even when the product is active in animals there is the problem of antigenicity. During treatment the animals will produce antibodies which neutralise the activity. So safety testing may prove difficult.

**Signaling in the Heart** José Marín-García, 2011-06-21 Signal transduction pathways are at the core of most biological processes and are critical regulators of heart physiology and pathophysiology. The heart is both a transmitter and dynamic receptor of a variety of intracellular and extracellular stimuli, playing a critical role of an integrator of diverse signaling mechanisms. Alterations in signaling pathways are contributing factors in the development and progression of a broad spectrum of diseases, ranging from dysrhythmias and atherosclerosis to hypertension and the metabolic syndrome. Targeting specific components of these signaling pathways has been shown to be effective in preclinical studies with significant therapeutic impact. This book brings together current knowledge in cardiovascular cell signal transduction mechanisms, advances in novel therapeutic approaches to improve cardiac function, and discussion of future directions. Presented from a post-genomic perspective, this exciting book introduces important new ideas in cardiovascular systems biology. It is an

invaluable reference for cardiology researchers and practitioners.
