Taking Shelter from the Storm ,1999

Severe Storm Engineering for Structural Design

Michele G. Melaragno,1996 Building codes and standards in other countries are studied in correlation to the number of casualties suffered during a violent storm. Specifically, Bangladesh is offered as a case study of minimum standards of building construction, while Australia is highlighted for having some of the strictest controls in the world. In 1990 and 1991, hurricanes Hugo, Andrew and Iniki pummeled the United States leveling residences, office buildings, a military base, and shopping areas. The devastation had a profound effect on the local communities, industries and commerce. Judging from the destruction these storms caused to the buildings in the area, it is clear that we still have a great deal to learn about designing structures to withstand hurricanes, typhoons and tornadoes. This book, for both the student and practicing architect or engineer, explores wind velocity typical of storms such as these. The weather conditions are then translated into actual forces on a structure to be used to better design build

Tertell,1999-10 Every year, tornadoes, hurricanes, & other extreme windstorms injure & kill people, & damage millions of dollars worth of property in the U.S. Having a shelter, or safe room, built into your house can help you protect yourself &

your family from injury or death caused by the dangerous forces of extreme winds. This report answers questions about your living conditions so you can decide how best to protect yourself & your family. Also provides shelter designs that will show your builder/contractor how to construct a shelter underneath, in the basement of, or in an interior room of a new house, or how to modify an existing house to add a shelter.

Summary Report on Building Performance - 2004 Hurricane Season (FEMA 490) Federal Emergency Agency, U. S. Department Security, 2013-04-26 The nation will remember 2004 as a record-setting year in terms of presidential disaster declarations and administered disaster aid. In 2004, President Bush issued 68 disaster declarations of which 27 were due to hurricanes. Time and again the U.S. was impacted by hurricane force winds and waves that damaged cities and small towns in 15 states, Puerto Rico, and the U.S. Virgin Islands. Of all the regions that endured the hurricane season, the State of Florida bore the brunt of the record-setting storms as Hurricanes Charley, Frances, Ivan, and Jeanne tested the federal and state fortitude in disaster response and recovery. Communities were devastated as wind and water damage from the four storms battered residential, commercial, industrial, and public facilities. Disaster assistance totaling more than \$4.4 billion was approved for Floridians, and to date, 1.24 million storm victims have applied for federal and state assistance (FEMA 2005b). The financial impact of the season will likely exceed \$20 billion, according to preliminary loss estimates from the Insurance Services Office's Property Claim Services (PCS). The four hurricanes that struck Florida in 2004 were all significant events; however, the hurricanes were each distinctive in terms of their wind and water

action and resulting damages. The first of these, Charley (designated a Category 4), was the first design level wind event to strike the U.S. mainland since Hurricane Andrew (1992) and caused more wind damage than flood damage. Frances (Category 2) and Jeanne (Category 3), while not as strong as Charley, were still very damaging hurricanes resulting in additional wind damage. Hurricane Ivan delivered not only strong winds (Category 3), but also caused significant flood damage to buildings and other structures, even those built above the 100-year flood elevation. The impact of the four hurricanes was intensified by their back-to-back occurrence; three of the hurricanes followed similar paths or had overlapping damage swaths. Frances and Jeanne followed almost identical paths across Florida from the east coast (around Port St. Lucie) to the west coast (north of Tampa area). These two very wide storms crossed the path of Charley (which traveled west to east) in central Florida creating an overlap of impacted areas in Orange, Osceola, Polk, and Hardee counties. As a result of these overlapping impact swaths, damage resulting from the later hurricanes (Frances and Jeanne) was difficult to distinguish from earlier damage caused by Charley. For instance, roofs that failed during Frances or Jeanne may have been weakened or damaged by Charley and more prone to failure. For this reason, most of the recommendations and conclusions contained in this report are based on observations made after Hurricanes Charley and Ivan and are supported by observations made after Hurricanes Frances and Jeanne. Following

Hurricanes Charley and Ivan, the FEMA Mitigation Assessment Teams (MATs) performed field observations to determine how well buildings in Florida and Alabama performed under stresses caused by the storms' wind and water impacts. A Rapid Response Data Collection Team performed field observations after Hurricane Frances that focused on critical and essential facilities; however an assessment was not performed after Jeanne, because Jeanne and Frances impacted a similar region. Overall, the MAT observed building performance success in structural systems designed and built after Hurricane Andrew. This Summary Report focuses on the ongoing need for improvement in building performance.

Hurricanes Irma and Maria in the U.S. Virgin Islands William L. Coulbourne, Cherylyn Henry, Thomas Lee Smith, 2021 Hurricanes Irma and Maria in the US Virgin Islands: Building Performance Observations and Recommendations for ASCE 7 examines the wind effects of Hurricanes Irma and Maria on engineered buildings and compares them to the relevant wind design provisions of ASCE 7.

The Perfect Storm of the European Crisis Ruxandra Iordache, Dan Dungaciu, 2017-06-23 The most significant phenomenon occurring around us today is the European crisis. As well as being a "total social phenomenon" as classical French sociologist Émile Durkheim would have said, it also affects all the levels of our lives—be they political, economic, cultural or social. Nothing remains untouched. In other words, it represents a "perfect storm". This volume brings together the

contributions of twenty authors, scientists from the “Ion I.C. Brătianu” Institute of Political Sciences and International Relations of the Romanian Academy, in response to this challenge. Using an expression that is becoming more abundantly associated with Europe, namely “the perfect storm”, the book decodes multiple layers of the crisis, whether they relate to migrants, terrorism, Brexit, the economic crisis of the Eurozone, the Turkish challenge, Russian pressures, TTIP, the resurrection of populism, or the (intermittent) hysteria of the European media.

In the Eye of the Storm Sharon G. Feldman, 2009
Barcelona, the cultural epicenter of Catalunya, is presently experiencing the most dynamic and polemical period in its modern theater history. It is the commanding hub of an energetic theater scene that in recent years has witnessed an exuberant outpouring of new dramatists, a steady crescendo in theater attendance, and a continual increase in the international presence of Catalan directors, playwrights, and companies. Barcelona's post-Olympian cultural landscape, moreover, comprises several architecturally striking theater projects. The diversity of opportunities to stage plays in Catalan at an assortment of city spaces is unprecedented, ranging in variety from commercial locales to publicly funded stages to experimental alternative venues. Since its origins in the nineteenth century, modern Catalan drama has frequently exhibited a cosmopolitan and even transnational impulse, engaging in an artistic dialogue with international theater traditions of both past and present and forging its identity

vis-a-vis its intercultural associations. The path along which the contemporary Catalan theater scene has struggled to recover and reconstitute the professional legitimacy and visibility that it lost during the Franco dictatorship has been a complex process, never lacking in melodramatic excess, witnessed both on and off the stage. The Barcelona stage, throughout its contemporary evolution, has been immersed in a stormy climate, whose relentlessly frenetic atmospheric activity at times may impede one from acquiring the distance necessary to see beyond the hurricane. -- Book Jacket.

Hurricane Mitigation for the Built Environment

Ricardo A. Alvarez, 2015-11-24 Alvarez drives home the point that for buildings and communities located in hurricane-prone regions, it is not a question of whether the area will be impacted, but when it will be impacted. The book makes a strong case for taking responsibility to understand the vulnerabilities of buildings and structures to hurricane impacts. Timothy Reinhold, P

Mitigation Assessment Team Report: Hurricane Charley in Florida - Observations, Recommendations, and Technical Guidance (FEMA 488)

U. s. Department of Homeland Security, Federal Emergency Management Agency, 2013-04-26 Hurricane Charley made landfall on Friday, August 13, 2004, at Mangrove Point, just southwest of Punta Gorda, Florida. On August 19, 2004, the Federal Emergency Management Agency's (FEMA's) Mitigation Division deployed a Mitigation Assessment Team (MAT) to

Florida to assess damages caused by Hurricane Charley. This report presents the MAT's observations, conclusions, and recommendations in response to those field investigations. Several maps included in our first chapter illustrate the path of the storm, the wind field estimates, the impact on people and infrastructure, and the depth of storm surge along the path. The width of the high-wind field was very narrow even though hurricane force winds affected some portion of the Florida peninsula from Punta Gorda to Daytona Beach. There was little storm surge or coastal flooding because of the narrow size of the storm and the translational speed with which it came ashore and crossed the state. The hurricane is believed to have been a design wind event (the wind speeds equaled or exceeded those delineated in the current version of the Florida Building Code [FBC]) for a narrow area from the point of landfall on the west coast inland for 120 miles. The design wind speed for Charlotte County (Punta Gorda) per the FBC is 114 to 130 mph (measured as a 3-second peak gust). The actual measured wind speed near Punta Gorda was 112 mph (3-second peak gust) and measured speeds in other parts of the state suggest that Charley was a design wind event. The storm created a very small area affected by storm surge and most damage was not caused by flooding from storm surge, waves, or erosion. Because Hurricane Charley was a design level wind event, the resultant storm damage provides valuable evidence about the effectiveness of building codes and design practices as they address design guidelines for high winds. For

buildings built prior to the adoption of the current codes, judgments were made about how the observed damage was reflective of the code to which the building was constructed, and the quality of construction or the inspection process that followed construction. Consideration also was given to the type and use of buildings. Many buildings that were expected to function for critical/essential services were severely damaged by the hurricane and lost function for significant periods of time after the event. The recommendations in this report are based solely on the observations and conclusions of the MAT, and are intended to assist the State of Florida, local communities, businesses, and individuals in the reconstruction process and to help reduce damage and impact from future natural events similar to Hurricane Charley. The general recommendations presented in Section 8.1 relate to policies and education/outreach that are needed to ensure that designers, contractors, and building officials understand the requirements for disaster resistance construction in hurricane-prone regions.
