A Multi-level Radar Storm Contour Mapper William E. Lamkin, David Atlas, 1965

A Multi-level Radar Storm Contour Mapper William E. Lamkin, David Atlas, 1965

The design and performance of a multi-level radar storm contour mapper is described. The instrument provides six quantized output signals each of which corresponds to a preselected class of signal intensity or reflectivity. The outputs are coded in a stepped grey scale so that a storm echo is mapped in bands of white, grey, and half grey, interspersed by bands of black; each band corresponds to the selected signal category. The contour coding may be altered so that the contour bands appear dotted or dashed. The system incorporates a wide (80 db) dynamic range receiver to permit mapping of severe storms without saturation, and an alarm to alert the operator in the event the uppermost signal category is exceeded. Resistance-Capacitance (RC) range integration is employed to smooth the highly fluctuating precipitation echoes and provide sharp contour boundaries closely representing the true average signal intensity. The addition of relatively simple integrators to the output lines of each reflectivity class would permit the use of the system for areal rainfall measurements. The system's performance with the FPS-6 height-finder radar and the CPS-9 is illustrated. (Author).

Contourites M. Rebescio, A. Camerlenghi, 2008-11-25 Contourites are sediments deposited or substantially reworked by bottom currents. The study of contourites is crucial for several fields of fundamental and applied

research: paleoclimatology and paleo-oceanography, since these fairly continuous and relatively high-resolution sediments hold the key for priceless information on the variability in circulation pattern, current velocity, oceanographic history and basin interconnectivity; hydrocarbon exploration, since accumulation of source rocks may be favored by weak bottom currents, whereas clean deep-sea sands may be formed by robust flows; and slope stability, since low-permeability fine-grained contourites facilitate the formation of overpressurized gliding planes when fresh contourites with a high pore-water content becomes rapidly loaded, or when their rigid biosiliceous microfabric collapses due to diagenetic conditions. Despite its significance, this group of sediments is poorly known by the majority of non-specialists. Notwithstanding the growing interest and the intensified research in contourites, a textbook that might also serve as a reference book on contourites was missing until now. This book addresses all aspects of the knowledge in the field of contourites and provides an authoritative and comprehensive coverage of the subject. It also can serve as a standard reference work for non-specialists, and in particular postgraduate students, university teachers and lecturers, researchers and professionals who are seeking an authoritative source of information about contourites. * reviews both theoretical topics and case histories * provides practical advice on multidisciplinary research techniques * provides also nonspecialist users with an intuitively-accessible, cross-referenced, and comprehensive coverage

of the knowledge in the field. * provides a helpful tool for research in the preparation of classroom lectures

An Automated Real-time Storm Analysis and Storm Tracking Program (WEATRK)

Carlton J. Bjerkaas,1980 The evolution of the WEATRK system is described from the original software obtained under contract in 1977, to the present software configuration. The various portions of the software are discussed with emphasis on the algorithms used to determine storm significance and establish the storm track. Results of the two-year development effort and operational tests show the usefulness of assimilating large amounts of complex data and generating a computer-synthesized product easily used in forecast applications. The error analysis performed on the storm track forecast accuracy suggests that few of the errors encountered are due to meteorological effects but they are largely due to parameters such as beam width, pulse width, antenna rotation rate and rounding errors. The non-meteorological errors appear to average out over large data sets; that is, the longer the storm track the smaller the forecast error. Although the program now uses a three-dimensional analysis, very little analysis is performed on the velocity and variance fields. The usefulness of these fields along with other improvements are considered.

Weather Forecasting for Aeronautics Joseph J. George,2014-05-12 Weather Forecasting for Aeronautics provides forecasters and pilots wanting to study more about the art and science of predicting weather with the essential aids and methods for making practical application of their knowledge of the fundamentals of the science of meteorology. The publication first underscores the forecast problem, construction of the prognostic pressure chart, and prediction of cyclogenesis. Discussions focus on forecasting information concerning new cyclogenesis, making operational and planning forecasts, cyclogenesis off the east coast of Asia, application of weather forecasts to operational problems, and cyclogenesis in the eastern United States. The text then ponders on forecasting the movement, deepening, and filling of cyclones and movement of anticyclones in North America. The manuscript takes a look at the movement of cold lows at the 500-millibar level and their influence on

surface lows, displacement of surface cold fronts, and warm frontal analysis and movement. Topics include movement of warm fronts, identification and location of warm fronts, East Coast wedge type, and warm frontogenesis. The text then examines the movement of tropical cyclones, prediction of very low ceiling and fogs, and prediction of severe weather. The publication is a dependable reference for weather forecasters and pilots.
