The Complete Book on Printing Technology NIIR Board Author,2003-07-02 Printing Industry generates a wide range of products which require in every step of our everyday life. Starting from newspapers, magazines, books, post cards to memo pads and business order forms each are the products of printing industry. Printing is a process for reproducing text and image, typically with ink on paper using a printing press. There are various types of printing process for example offset printing, modern printing, gravure printing, flexographic printing etc. Offset printing is a widely used printing technique where the inked image is transferred from a plate to a rubber blanket, then to the printing surface. When used in combination with the lithographic process, the offset technique employs a flat image carrier on which the image to be printed obtains ink from ink rollers, while the non printing area attracts a film of water, keeping the non printing areas ink free. Gravure printing is a printing technique, where the image to be printed is made up of small depressions in the surface of the printing plate. It is divided into three broad product areas; packaging printing, publication printing and speciality printing. Printing technology is often carried out as a large scale industrial process, and is an essential part of publishing and transaction printing. This is the age of hi fi, jets and computers. Rapid advancements in science and technology have made their impact on the printing industry of the world too. The old techniques of printing have become obsolete and made way for the new technology. The printing industry is just one example of an entire industry movement that is changing while keeping up with the development of new technologies. The proliferation of emerging technologies has dictated a rebirth of the printing industry. The Indian Printing Industry is well established and presently growing at 12% per annum. This book majorly deals with typographic technology, photo scanning systems, sequence of steps in the printing processes, size and scope of the printing industry, high volume printing technologies for the production of polymer electronic structures, inking system, film high contrast printing, principle of planographic printing, modern printing process, ink jet etc. The book contains the latest printing processes like web, gravure, flexo, security and offset printing. This book is an invaluable resource for new entrants, technicians, craftsmen and executives working with printing industries. Plate to Substrate Ink Transfer in the Flexographic Printing Process David George Beynon, 2007 Investigations have been conducted into the transfer of ink from the plate to the substrate in flexographic printing. Four experimental trials have been conducted at full press scale in order to investigate process parameters including substrate type and the effect of over printing previously printed ink. In order that the shape of printed dots could be analysed methods for the determination of plate dot circularity and printed dot circularity were developed. Accurate measurement of the printing plates used in the experimental investigations has revealed significant differences in nominally identical patches within the same plate. Dot size and geometry was found to be permanently altered through the application of pressure in the plate/anilox nip. The volume of ink supplied to the plate is found to have the largest effect on ink transfer to the substrate. Increases in anilox volume and engagement between plate and substrate are found to increase ink spreading. Decreasing viscosity reduces ink transfer to the plate from the anilox which in turn results in lower ink spreading for individual dots. Joined dots however show an increase in ink spreading due to increased entrapment of ink at the nip entrance. The shape of printed dots is found to be affected by the volume of ink transfer and by engagement. Larger dot volumes increase dot circularity and larger engagements reduce dot circularity. The effect of under printed ink on ink transfer of subsequently printed ink is dependent on the coverage of under printed ink and the substrate being printed. For non porous substrate the under printed ink acts as a barrier to ink spreading. On porous substrate the density of samples is increased due to the under print filling surface pores increasing ink spreading for subsequently printed ink. The effect of under print is visible for all substrates and over print coverages.
