*Google Maps Hacks* Rich Gibson,Schuyler Erle,2006-01-17 Want to find every pizza place within a 15-mile radius? Where the dog parks are in a new town? The most central meeting place for your class, club or group of friends? The cheapest gas stations on a day-to-day basis? The location of convicted sex offenders in an area to which you may be considering moving? The applications, serendipitous and serious, seem to be infinite, as developers find ever more creative ways to add to and customize the satellite images and underlying API of Google Maps. Written by Schuyler Erle and Rich Gibson, authors of the popular Mapping Hacks, Google Maps Hacks shares dozens of tricks for combining the capabilities of Google Maps with your own datasets. Such diverse information as apartment listings, crime reporting or flight routes can be integrated with Google's satellite imagery in creative ways, to yield new and useful applications. The authors begin with a complete introduction to the standard features of Google Maps. The adventure continues with 60 useful and interesting mapping projects that demonstrate ways developers have added their own features to the maps. After that's given you ideas of your own, you learn to apply the techniques and tools to add your own data to customize and manipulate Google Maps. Even Google seems to be tacitly blessing what might be seen as unauthorized use, but maybe they just know a good thing when they see one. With the tricks and techniques you'll learn from Google Maps Hacks, you'll be able to adapt Google's satellite map feature to create interactive maps for personal and commercial applications for businesses ranging from real estate to package delivery to home services, transportation and more. Includes a foreword by Google Maps tech leads, Jens and Lars Rasmussen.

Reasoning Web. Explainable Artificial Intelligence Markus Krötzsch,Daria Stepanova,2019-09-17 This volume contains lecture notes of the 15th Reasoning Web Summer School (RW 2019), held in Bolzano, Italy, in September 2019. The research areas of Semantic Web, Linked Data, and Knowledge Graphs have recently received a lot of attention in academia and industry. Since its inception in 2001, the Semantic Web has aimed at enriching the existing Web with meta-data and processing methods, so as to provide Web-based systems with intelligent capabilities such as context awareness and decision support. The Semantic Web vision has been driving many community efforts which have invested a lot of resources in developing vocabularies and ontologies for annotating their resources semantically. Besides ontologies, rules have long been a central part of the Semantic Web framework and are available as one of its fundamental representation tools, with logic serving as a unifying foundation. Linked Data is a related research area which studies how one can make RDF data available on the Web and interconnect it with other data with the aim of increasing its value for everybody. Knowledge Graphs have been shown useful not only for Web search (as demonstrated by Google, Bing, etc.) but also in many application domains.

Additionally, many universities and educational institutions have their own digital libraries that provide free access to PDF books and manuals. These libraries often offer academic texts, research papers, and technical manuals, making them invaluable resources for students and researchers. Some notable examples include MIT OpenCourseWare, which offers free access to course materials from the Massachusetts Institute of Technology, and the Digital Public Library of America, which provides a vast collection of digitized books and historical documents.
