Metallo-Supramolecular Polymers Masayoshi Higuchi,2019-11-12 This book

introduces the synthesis, electrochemical and photochemical properties, and device applications of metallo-supramolecular polymers, new kinds of polymers synthesized by the complexation of metal ions and organic ditopic ligands. Their electrochemical and photochemical properties are also interesting and much different from conventional organic polymers. The properties come from the electronic intra-chain interaction between the metal ions and the ligands in the polymer chain. In this book, for example, the electrochromism that the Fe(II)-based metallo-supramolecular polymer exhibits is described: the blue color of the polymer film disappears by the electrochemical oxidation of Fe(II) ions to Fe(III) and the colorless film becomes blue again by the electrochemical reduction of Fe(III) to Fe(II). The electrochromism is explained by the disappearance/appearance of the metal-to-ligand charge transfer absorption. The electrochromic properties are applicable to display devices such as electronic paper and smart windows.

Targeted Metallo-Drugs Etelka Farkas, Celine J. Marmion, 2023-05-15 Volume 24, entitled Targeted Metallo-Drugs: Design, Development, and Modes of Action, of the series Metal Ions in Life Sciences (MILS), fosters inter-disciplinary research in the vibrant field of Biological Inorganic Chemistry. Inspired by the clinical success of cisplatin as a leading anticancer drug but mindful of the shortcomings associated with its use including dose-limiting toxic side effects and acquired or intrinsic drug resistance, scientists across the globe have been endeavoring to identify new metallo-drugs for therapeutic exploitation. This has led to innovative metallo-drug candidates that (i) enhance cancer cell selectivity, thus reducing toxic side effects, and/or (ii) possess new modes of action to improve

efficacy and also target resistance pathways. This and more are captured in MILS- 24 which consists of 12 comprehensive, well-illustrated, and up to date chapters with over 1600 citations, 100 figures, and 10 tables with key contributions from 32 international experts from Europe, Asia, and North and South America. MILS- 24 not only keeps the scientific community abreast of latest developments, it also serves as an invaluable resource to stimulate further research on targeted metallo-drug design and development. It covers anticancer, antimicrobial, antiviral, and other agents, such as those targeting tropical diseases and cyanide poisoning and radiometals in molecular imaging and therapy. It highlights recent metallo-drug developments targeting COVID-19. It features advanced spectroscopic methods and metallomics as important tools to elucidate the modes of actions of metallo-drugs.

Metallo-Drugs: Development and Action of Anticancer Agents Astrid

Sigel, Helmut Sigel, Eva Freisinger, Roland K.O. Sigel, 2018-02-05 Volume 18, entitled Metallo-Drugs: Development and Action of Anticancer Agents of the series Metal Ions in Life Sciences centers on biological, medicinal inorganic chemistry. The serendipitous discovery of the antitumor activity of cis-diamminodichloroplatinum(II) (cisplatin) by Barnett Rosenberg in the 1960s is a landmark in metallodrug-based chemotherapy. The success of cisplatin in the clinic, followed by oxaliplatin and carboplatin, along with their drawbacks relating mainly to resistance development and severe toxicity, initiated research on polynuclear platinum complexes and on Pt(IV) complexes as prodrugs. Furthermore, the indicated shortcomings led to the exploration of other transition and main group metal ions, among them Ru(II/III), Au(I/III), Ti(IV), V(IV/V), and Ga(III).

including also the essential metal ions Fe(II/III), Cu(I/II), and Zn(II). Ionic as well as covalent and non-covalent interactions between structurally very different complexes and biomolecules like nucleic acids, proteins, and carbohydrates are studied and discussed with regard to their possible anticancer actions. Hence, MILS-18 summarizes the research at the forefront of medicinal inorganic chemistry, including studies on the next-generation, tailor-made anticancer drugs. All this and more is treated in an authoritative and timely manner in the 17 stimulating chapters of this book, written by 39 internationally recognized experts from 10 nations (from the US via Europe to China and Australia). The impact of this vibrant research area is manifested by more than 2700 references, nearly 150 illustrations (more than half in color) and several comprehensive tables. *Metallo-Drugs: Development and Action of Anticancer Agents* is an essential resource for scientists working in the wide range from enzymology, material sciences, analytical, organic, and inorganic biochemistry all the way through to medicine including the clinic ... not forgetting that it also provides excellent information for teaching.

Metallo Organic Chemistry Anthony J. Pearson, 1985-05-27 Presents the basic chemistry of organo-transition metal complexes in the context of real synthetic applications. Examples of de novo syntheses of natural product molecules are used to illustrate the application of established reactivity patterns to organic synthesis. Explains

reactivity phenomena by using frontier molecular orbital approaches. Discusses fundamental reactivity and bonding patterns while giving broad coverage of organometallic chemistry.
