A New Perspective on Relativity Bernard H. Lavenda,2012 Starting off from noneuclidean geometries, apart from the method of Einstein's equations, this book derives and describes the phenomena of gravitation and diffraction. A historical account is presented, exposing the missing link in Einstein's construction of the theory of general relativity: the uniformly rotating disc, together with his failure to realize, that the Beltrami metric of hyperbolic geometry with constant curvature describes exactly the uniform acceleration observed. This book also explores these questions: * How does time bend? * Why should gravity propagate at the speed of light? * How does the expansion function of the universe relate to the absolute constant of the noneuclidean geometries? * Why was the Sagnac effect ignored? * Can Maxwell's equations accommodate mass? * Is there an inertia due solely to polarization? * Can objects expand in elliptic geometry like they contract in hyperbolic geometry?

The logic of modern physics P. W. Bridgman,2023-07-10 The logic of modern physics by P. W. Bridgman. Published by Good Press. Good Press publishes a wide range of titles that encompasses every genre. From well-known classics & literary fiction and non-fiction to forgotten—or yet undiscovered gems—of world literature, we issue the books that need to be read. Each Good Press edition has been meticulously edited and formatted to boost readability for all e-readers and devices. Our goal is to produce eBooks that are user-friendly and accessible to everyone in a high-quality digital format.

Space-Perception and the Philosophy of Science Patrick A. Heelan,2023-07-28 Drawing on the phenomenological tradition in the philosophy of science and philosophy of nature, Patrick Heelan concludes that perception is a cognitive, world-building act, and is therefore never absolute or finished.

Models and Methods in the Philosophy of Science: Selected Essays Patrick Suppes,2013-03-14 The thirty-one papers collected in this volume represent most of the articles that I have published in the philosophy of science and related foundational areas of science since 1970. The present volume is a natural successor to *Studies in the Methodology and Foundations of Science*, a collection of my articles published in 1969 by Reidel (now a part of Kluwer). The articles are arranged under five main headings. Part I contains six articles on general methodology. The topics range from formal methods to the plurality of science. Part II contains six articles on causality and explanation. The emphasis is almost entirely on probabilistic approaches. Part III contains six articles on probability and measurement. The importance of representation theorems for both probability and measurement is stressed. Part IV contains five articles on the foundations of physics. The first three articles are concerned with action at a distance and space and time, the last two with quantum mechanics. Part V contains eight articles on the foundations of psychology. This is the longest part and the articles reflect my continuing strong interest in the nature of learning and perception. Within each part the articles are arranged chronologically. I turn now to a more detailed overview of the content. The first article of Part I concerns the role of formal methods in the philosophy of science. Here I discuss what is the new role for formal methods now that the imperialism of logical positivism has disappeared.

The Emergence of Logical Empiricism Sahotra Sarkar,1996 Twenty-nine collected essays represent a critical history of Shakespeare's play as text and as theater, beginning with Samuel Johnson in 1765, and ending with a review of the Royal Shakespeare Company production in 1991. The criticism centers on three aspects of the play: the love/friendship debate.

The Philosophy of Science Richard Boyd,Philip Gasper,J. D. Trout,1991 The more than forty readings in this anthology cover the most important developments of the past six decades, charting the rise and decline of logical positivism and the gradual emergence of a new consensus concerning the major issues and theoretical options in the field. As an introduction to the philosophy of science, it stands out for its scope, its coverage of both historical and contemporary developments, and its detailed introductions to each area discussed.

The Logic of Modern Physics Percy Williams Bridgman,1927

Philosophy of Mathematics Stewart Shapiro,1997-08-07 Shapiro argues that both realist and anti-realist accounts of mathematics are problematic. To resolve this dilemma, he articulates a structuralist approach, arguing that the subject matter of a mathematical theory is not a fixed domain of numbers that exist independent of each other, but rather is the natural structure, the pattern common to any system of objects that has an initial object and successor relation satisfying the induction principle.

Sight and the Ancient Senses Michael Squire,2015-12-22 It is to Greek critical thinking about seeing that we owe our conceptual framework for theorizing the senses, and it is also to such thinking that we owe the lasting legacy of Greco-Roman imagery. *Sight and the Ancient Senses* is the first thorough introduction to the conceptualization of sight in the history, visual culture, literature and philosophy of classical antiquity. Examining how the Greeks and Romans interpreted what they saw, the collection also considers sight in relation to the other senses. This volume brings together a number of interdisciplinary perspectives to deliver a broad and balanced coverage of this subject. Contributors explore the cultural, social and intellectual backdrops that gave rise to ancient theories of seeing, from Archaic Greece through to the advent of Christianity in late antiquity. This series of specially commissioned thematic chapters demonstrate how theories about sight informed Graeco-Roman philosophy, science, poetry rhetoric and art. The collection also reaches beyond its Graeco-Roman visual framework, showcasing how ancient ideas have influenced the *longue durée* of western sensory thinking. Richly illustrated throughout, including a section of color plates, *Sight and the Ancient Senses* is a wide-ranging introduction to ancient theories of seeing which will be an invaluable resource for students and scholars of classical antiquity.

From Sight to Light A. Mark Smith,2017-11-16 From its inception in Greek antiquity, the science of optics was aimed primarily at explaining sight and accounting for why things look as they do. By the end of the seventeenth century, however, the analytic focus of optics had shifted to light: its fundamental properties and such physical behaviors as reflection, refraction, and diffraction. This dramatic shift—which A. Mark Smith characterizes as the “Keplerian turn”—lies at the heart of this fascinating and pioneering study. Breaking from previous scholarship that sees Johannes Kepler as the culmination of a long-evolving optical tradition that traced back to Greek antiquity via the Muslim Middle Ages, Smith presents Kepler instead as marking a rupture with this tradition, arguing that his theory of retinal imaging, which was published in 1604, was instrumental in prompting the turn from sight to light. Kepler’s new theory of sight, Smith reveals, thus takes on true historical significance: by treating the eye as a mere light-focusing device rather than an image-producing instrument—as traditionally understood—Kepler’s account of retinal imaging helped spur the shift in

analytic focus that eventually led to modern optics. A sweeping survey, *From Sight to Light* is poised to become the standard reference for historians of optics as well as those interested more broadly in the history of science, the history of art, and cultural and intellectual history.

Language, Man, Society Harold Edgar Briggs,1949 This book is intended for both the regular Freshman English course and the newer Communication classes. For the former it offers models of the various types and techniques of writing, such as autobiography, biography, other kinds of narration, description, research papers, reviews, definitions, processes, and analysis. For the latter it offers material on the media of communication, round tables, a radio play, cartoons, semantics, and oral English, with the possibility of making use of recordings. For both types of courses it offers stimulating ideas and examples of good modern writing.

Nature, Cognition and System II M.E. Carvallo,2013-03-07 is both a player and a spectator, is explained here illuminatingly. With regard to logical ambiguities and paradoxes, which may show up in all these topics, he, like Locker, is of the opinion that, philosophically speaking all apory of a lower level have to be accepted an a higher level of thinking. After the above expositions of a more general purport we turn now to two contributions which are particularly focused on Bohr's concept of complementarity. First is the article of Hilgevoord who briefly and non-technically describes a short curriculum vitae of the concept beginning with Planck through Bohr to Heisenberg and Schrodinger. Included in this short story, of course, is the famous wave-particle duality and the paradox inherent in it many physicists are still saddled with. How this paradox was solved is explained here simply and clearly: first, generally by quantum mechanics where the disturbance theory of measurement was supposed to be of some relevance, and secondly, where this theory is further refmed leading to Bohr's conclusion of the essential unsolvability, and accordingly the completeness, of the statistical element of quantum mechanics. The reading of this short article may arouse questions and surmises whether complementarity has been ruminated by Bohr to tame the law of excluded middle dividing the well-defined content of position measurement from that of momentum measurement, just to mention one. Whatever it may be the idea of complementarity betrays the perplexity of the observing system in dealing with nature's complexity.

Picturing Machines 1400-1700 Wolfgang Lefevre,2023-12-26 How technical drawings shaped early engineering practice. Technical drawings by the architects and engineers of the Renaissance made use of a range of new methods of graphic representation. These drawings—among them Leonardo da Vinci's famous drawings of mechanical devices—have long been studied for their aesthetic qualities and technological ingenuity, but their significance for the architects and engineers themselves is seldom considered. The essays in *Picturing Machines 1400-1700* take this alternate perspective and look at how drawing shaped the practice of early modern engineering. They do so through detailed investigations of specific images, looking at over 100 that range from sketches to perspective views to thoroughly constructed projections. In early modern engineering practice, drawings were not merely visualizations of ideas but acted as models that shaped ideas. *Picturing Machines* establishes basic categories for the origins, purposes, functions, and contexts of early modern engineering illustrations, then treats a series of topics that not only focus on the way drawings became an indispensable means of engineering but also reflect the main stages in their historical development. The authors examine the social interaction conveyed by early machine images and their function as communication between practitioners; the knowledge either conveyed or presupposed by technical drawings, as seen in those of Giorgio Martini and Leonardo; drawings that required familiarity with geometry or geometric optics, including the development of architectural plans; and technical illustrations that bridged the gap between practical and theoretical mechanics.
