Regenerative Leadership Giles Hutchins, 2019-07-16 This book by leadership and sustainability experts Giles Hutchins and Laura Storm provides an exciting and comprehensive framework for

building regenerative life-affirming businesses. It offers a multitude of business cases, fascinating examples from nature's living systems, insights from the front-line pioneers and tools and techniques for leaders to succeed and thrive in the 21st century. Regenerative Leadership draws inspiration from pioneering thinking within biomimicry, circular economy, adult developmental psychology, anthropology, biophilia, sociology, complexity theory and next-stage leadership development. It connects the dots between these fields through a powerful framework that enables leadership to become regenerative: in harmony with life, building thriving, prosperous organizations amid transformational times. The book is a combination of theoretical frameworks, case studies, tools & practices: Everything the leader needs to be successful in the 21st century. Regenerative Leadership - what's it all about? While the future is uncertain, we clearly see an upward trend towards sustainable conscious business. And this is more than just a trend - we're witnessing a new kind of organization emerging. An organization which is able to rapidly sense and respond to the ever-changing business climate by innovating how and why it creates and delivers value, and the way it engages internally and externally with its ecosystem of

employees, customers, suppliers, resources, investors, society and environment. This new kind of organization is the organization-as-living-system that is designed on the Logic of Life: life-affirming businesses that thrive from the inside out, by cultivating conditions conducive for life, internally and externally. These organizations nurture flourishing cultures while focusing on products and services that enhance society and the environment. Regenerative organizations will be tomorrow's success stories.

Perilous Place, Powerful Storms Craig E. Colten, 2010-06-30 The hurricane protection systems that failed New Orleans when Katrina roared on shore in 2005 were the product of four decades of engineering hubris, excruciating delays, and social conflict. In Perilous Place, Powerful Storms, Craig E. Colten traces the protracted process of erecting massive structures designed to fend off tropical storms and examines how human actions and inactions left the system incomplete on the eve of its greatest challenge. Hurricane Betsy in 1965 provided the impetus for Congress to approve unprecedented hurricane protection for the New Orleans area. Army Engineers swiftly outlined a

monumental barrier network that not only would safeguard the city at the time but also provide for substantial growth. Scheduled for completion in 1978, the project encountered a host of frustrating delays. From newly imposed environmental requirements to complex construction challenges, to funding battles, to disputes over proper structures, the buffer envisioned for southeast Louisiana remained incomplete forty years later as Hurricane Katrina bore down on the city. As Colten reveals, the very remedies intended to shield the city ultimately contributed immensely to the residents' vulnerability by encouraging sprawl into flood-prone territory that was already sinking within the ring of levees. *Perilous Place, Powerful Storms* illuminates the political, social, and engineering lessons of those who built a hurricane protection system that failed and serves as a warning for those guiding the recovery of post-Katrina New Orleans and Louisiana.

Passaic River Basin Flood Protection Project, Storm Surge Analysis Zeki Demirbilek, Raymond Walton, 1992

Tropical Cyclone Modification Robert C. Sheets, 1981 The Project Stormfury modification theory, its

physical basis, and the experiment design are described, and the possible effects of such experiments on tropical cyclone motion, rainfall, wind fields, and storm surge are examined. Studies of natural storm variability, exploratory experiments, sensitivity tests, numerical simulations, and theoretical calculations indicate that experiments conducted according to the Stormfury hypothesis could result in reductions of 10% to 15% in the maximum windspeed and associated damage reductions of 20% to 60%, with no apparent significant and/or detectable effect on storm motion or net rainfall accumulated areawide or at specific locations for a moving storm.
