Architectural Model as Machine Albert Smith, 2007-03-30 This book offers an explanation of why scale models are important to the design process. Albert Smith takes the reader through the history and significance of models in architecture from the magic of the Egyptian scale model to the present day. Through this description of the relationship between architecture and the scale model, Smith demonstrates the most effective process between concept and 'machine', between the idea and the final building. The great value of this book is to reveal the nature of the scale model and to unlock the tremendous potential of this design tool as a thinking and communicative advice. His chronological analysis goes on from Egypt through Rome to the relationship between the Greek paradigm scale model and then on to Medieval and Renaissance models. It concludes with the models of the Spanish architect Antonio Gaudi, the Russian Constructivists, the American architect Louis Khan and finally looks at the role of scale models in the present day through the work of the Polish/American architect Daniel Libeskind and the American Frank Gehry.

The Delft Prototype Laboratory M. Eekhout, P. van Swieten, 2016-03-10 The Prototype Laboratory initiated and maintained by the Chair of Product Development at the Faculty of Architecture, TU Delft, has set an example in architectural education for hands-on 'learning-by-making' for students. According to the authors of this book, in the current curriculums time spent on practical work is not rewarded and students are educated in an abstract concept of architecture, not getting a proper feeling for materialization. A semester of designing, engineering, producing and building a prototype with their own hands after their own design often gives students a boost in their education. The Delft Prototype laboratory was the base of around 1,000 students, now professionals. Some architect's offices make prototypes regularly as their designs are quite experimental and require more insight for the designing architect, before the realization of his building. Prototypes of technical components are often developed parallel to the building process. The Prototype Laboratory at the Faculty of Architecture was supervised for almost 18 years by Peter van Swieten. He describes his experiences in this book, in collaboration with the initiator, professor Mick Eekhout. Marcel Bilow took over the Bucky Lab, as it is called, from 2012 onwards.

Analogue and Numerical Modelling of Sedimentary Systems Poppe de Boer, George Postma, Kees van der Zwan, Peter Burgess, Peter Kukla, 2009-01-26 Understanding basin-fill evolution and the origin of stratal architectures has traditionally been based on studies of outcrops, well and seismic data, studies of and inferences on qualitative geological processes, and to a lesser extent based on quantitative observations of modern and ancient sedimentary environments. Insight gained on the basis of these studies can increasingly be tested and extended through the application of numerical and analogue forward models. Present-day stratigraphic forward modelling follows two principle lines: 1) the deterministic process-based approach, ideally with resolution of the fundamental equations of fluid and sediment motion at all scales, and 2) the stochastic approach. The process-based approach leads to improved understanding of the dynamics (physics) of the system, increasing our predictive power of how systems evolve under various forcing conditions unless the system is highly non-linear and hence difficult or perhaps even impossible to predict. The stochastic

approach is more direct, relatively simple, and useful for study of more complicated or less-well understood systems. Process-based models, more than stochastic ones, are directly limited by the diversity of temporal and spatial scales and the very incomplete knowledge of how processes operate and interact on the various scales. The papers included in this book demonstrate how cross-fertilization between traditional field studies and analogue and numerical forward modelling expands our understanding of Earth-surface systems.

Scale Models in Engineering Richard I. Emori, Dieterich J. Schuring, 2016-06-06 *Scale Models in Engineering: Fundamentals and Applications* provides a simple and fundamental method of designing scale model experiments. This book is divided into two parts. Part I explores the background of scale modeling and explains the design procedure of scale models and experiments. The relaxation method commonly applied to conflicting requirements in model design is also analyzed. Part II is devoted to case studies selected from modern fields of model application. These studies have been interpreted uniformly. This publication is designed not only as a college textbook for senior and graduate levels but also as a working reference for practicing engineers.

The Book of Memory Mary J. Carruthers, 1992-05-14 *The Book of Memory* is a magisterial and beautifully illustrated account of the workings and function of memory in medieval society. Memory was the psychological faculty valued above all others in the period stretching from late antiquity through the Renaissance. The prominence given to memory has profound implications for the contemporary understanding of all creative activity, and the social role of literature and art. Drawing on a range of fascinating examples from Dante, Chaucer, and Aquinas to the symbolism of illuminated manuscripts, this unusually wide-ranging book offers new insights into the medieval world.

Textiles in the Pacific, 1500-1900 Debin Ma, 2017-03-02 *Textiles in the Pacific, 1500-1900* brings together 13 articles which include both classics and lesser-known but important works related to the trade and production of textiles in the Pacific region, extending from the tip of Northeast Asia to the other end of South America and Australia. Collectively these articles bring out two central themes, as highlighted in the introduction. First, there is the leading role of textiles in linking up the economies across the Pacific in the era before the 19th-century rise of steam-engine-powered global integration. Second is the crucial role of textile manufacturing and trade in the early stage of industrialization for most of the developing Pacific economies after the 19th century. The volume also reflects both revolutionary shifts in paradigms and revisions of traditional consensus, and seeks to present a more balanced account of global trade and market integration in the early modern period.

Modeling for All Scales Howard T. Odum, Elisabeth C. Odum, 2000-02-03 All manner of models are used to describe, simulate, extrapolate, and ultimately understand the function of dynamic systems. These sorts of models are usually based upon a mathematical foundation that can be difficult to manipulate especially for students. Modeling for All Scales uses object-oriented programming to erect and evaluate the efficacy of models of small, intermediate and large scale systems. Such models allow users to employ intuitively based symbols and a systems ecology approach. The authors have been leaders in the systems ecology community and have originated much of the scientific vocabulary of the field. After introducing modeling and its benefits, there is a series of chapters detailing the more particular elements of successful simulation. There follows another series of chapters, each devoted to models of different sorts of systems. Small scale models of growth, competition, and evolution give way, successively, to larger and larger scale models such as international trade and the global geobiosphere. Anyone interested in an easy to use approach to modeling complex systems authored by perhaps the most original systems ecologists of the century will want this book. To further enhance the users ability to apply the lessons of this book, there is included a CD-ROM disc which provides the fundamental tools for modeling at all scales. Key Features * The book makes it possible to teach modeling and simulation without much prior knowledge of mathematics * Reasons for modeling and simulation are discussed * The book makes modeling and simulation fun by keeping focused on simplified overview minimodels that have important principles to science and society * The steps in successive chapters are arranged so that readers can teach themselves modeling, simulation, and the programming necessary to simulate the systems they diagram * The CD-ROM has minimodel programs and versions of QuickBasic and EXTEND to run them

The Principles Of Statecraft For Defining A New 'North-South' Order Lyndon LaRouche, "The chief source of corruption of statesmen, apart from the reaction-formation to fear of Kissinger's masters, is the influence of the putative professional economists." --Lyndon LaRouche Written to expose the incompetence of the economics "profession," and to present to world leaders the pathway out of the collapsing British Imperial monetary system, and into a bright future of general prosperity, this book continues to be a handbook to statesmen who love their nation-states as well as humanity in general. Of all of Mr. LaRouche's writings on physical economy, this book presents the clearest outline of the principles and applications of Hamiltonian national credit-creation tied to an international gold reserve-based monetary system--in other words, the New Bretton Woods agreement which will replace the predatory and disastrous imperial monetary system which has enforced backwardness and war upon so much of the world for so long.

Handbook of Statistical Modeling for the Social and Behavioral Sciences G. Arminger, Clifford C. Clogg, M.E. Sobel, 2013-06-29 Contributors thoroughly survey the most important statistical models used in empirical reserch in the social and behavioral sciences. Following a common format, each chapter introduces a model, illustrates the types of problems and data for which the model is best used, provides numerous examples that draw upon familiar models or procedures, and includes material on software that can be used to estimate the models studied. This handbook will aid researchers, methodologists, graduate students, and statisticians to understand and resolve common modeling problems.
