Mössbauer Spectroscopy Applied to Inorganic Chemistry G.J Long,F. Grandjean,2013-11-11 In 1988 the Mossbauer effect community completed 30 years of continual contribution to the fields of nuclear physics, solid state science, and a variety of related disciplines. To celebrate this anniversary, Professor Gonser of the Universitat des Saarlandes has contributed a chapter to this volume on the history of the effect. Although Mossbauer spectroscopy has reached its mature years, the chapters in this volume illustrate that it is still a dynamic field of science with applications to topics ranging from permanent magnets to biological mineralization. During the discussion of a possible chapter for this volume, a potential author asked, Do we really need another Mossbauer book? The editors responded in the affirmative because they believe that a volume of this type offers several advantages. First, it provides the author with an opportunity to write a personal view of the subject, either with or without extensive pedagogic content. Second, there is no artificially imposed restriction on length. In response to the question, How long should my chapter be?, we have responded that it should be as long as is necessary to clearly present, explain, and evaluate the topic. In this type of book, it is not necessary to condense the topic into two, four, or eight pages as is now so often a requirement for publication in the research literature.

Photosynthetic Excitons Herbert van Amerongen,Leonas Valkunas,Rienk van Grondelle,2000 Excitons are considered as the basic concept used by describing the spectral properties of photosynthetic pigment-protein complexes and excitation dynamics in photosynthetic light-harvesting antenna and reaction centers. Following the recently obtained structures of a variety of photosynthetic pigment-protein complexes from plants and bacteria our interest in understanding the relation between structure, function and spectroscopy has strongly increased. These data demonstrate a short interpigment distance (of the order of 1 nm or even smaller) and/or a highly symmetric (ring-like) arrangement of pigment molecules in peripheral light-harvesting complexes of photosynthetic bacteria. Books which were devoted to the exciton problem so far mainly considered the spectral properties of molecular crystals. However, the small size of these pigment aggregates in the pigment-protein complexes as well as the role of the protein, which is responsible for the structural arrangement of the complex, clearly will have a dramatic influence on the pigment spectra and exciton dynamics. All these aspects of the problem are considered in this book. Exciton theory is mainly considered for small molecular aggregates (dimers, ring-like structures etc.). Together with the theoretical description of the classical conceptual approach, which mainly deals with polarization properties of the absorption and fluorescence spectra, the nonlinear femtosecond spectroscopy which is widely used for investigations now is also discussed. A large part of the book demonstrates the excitonic effects in a multitude of photosynthetic pigment-protein complexes and how we can understand these properties on the basis of the exciton concept.

After Revolution Florence E. Babb,2010-01-01 Nicaragua's Sandinista revolution (1979-1990) initiated a broad program of social transformation to improve the situation of the working class and poor, women, and other non-elite groups through agrarian reform, restructured urban employment, and wide access to health care, education, and social services. This book explores how Nicaragua's least powerful citizens have fared in the years since the Sandinista revolution, as neoliberal governments have rolled back these state-supported reforms and introduced measures to promote the development of a market-driven economy. Drawing on ethnographic research conducted throughout the 1990s, Florence Babb describes the negative consequences that have followed the return to a capitalist path, especially for women and low-income citizens. In addition, she charts the growth of women's and other social movements (neighborhood, lesbian and gay, indigenous, youth, peace, and environmental) that have taken advantage of new openings for political mobilization. Her ethnographic portraits of a low-income barrio and of women's craft cooperatives powerfully link local, cultural responses to national and global processes.

Different? is an accessible and fascinating look at the idea of race, demonstrating how current scientific understanding is often inconsistent with popular notions of race. Taken from the popular national public education project and museum exhibition, it explores the contemporary experience of race and racism in the United States and the often-invisible ways race and racism have influenced laws, customs, and social institutions.

Photosynthesis in silico Agu Laisk,Ladislav Nedbal,Govindjee,2009-06-19 Photosynthesis in silico: Understanding Complexity from Molecules to Ecosystems is a unique book that aims to show an integrated approach to the understanding of photosynthesis processes. In this volume - using mathematical modeling - processes are described from the biophysics of the interaction of light with pigment systems to the mutual interaction of individual plants and other organisms in canopies and large ecosystems, up to the global ecosystem issues. Chapters are written by 44 international authorities from 15 countries. Mathematics is a powerful tool for quantitative analysis. Properly programmed, contemporary computers are able to mimic complicated processes in living cells, leaves, canopies and ecosystems. These simulations - mathematical models - help us predict the photosynthetic responses of modeled systems under various combinations of environmental conditions, potentially occurring in nature, e.g., the responses of plant canopies to globally increasing temperature and atmospheric CO2 concentration. Tremendous analytical power is needed to understand nature's infinite complexity at every level.
