Books I-III Ludger Hovestadt, 2022-12-19 Treatise on digital architecture Hovestadt's treatise strictly follows the model of the famous treatises by Vitruvius (De architectura) and Alberti (De re aedificatoria), based on the supposition that we find ourselves in a comparable situation today. Vitruvius and Alberti expressed the meaning of architecture in their eras: Roman antiquity and the Renaissance. Hovestadt has done the same for the present day, incorporating considerations of physics, mathematics, technology, literature, and philosophy. Books I to III deal with the role of the architect and the objectivity of architecture. Books IV to VI address the modalities of speaking about and encoding architecture: the secret, the public, and the private. Books VII to X are dedicated to actual digital mechanisms: artificial intelligence, natural communication, gnomonics, and cultural heritage. An architectural treatise for our age in 10 books Inspired by the works of Vitruvius and Alberti Published in three volumes in the Applied Virtuality Book Series

Mathematical Foundations of Image Processing and Analysis Jean-Charles Pinoli, 2014-07-22 Mathematical Imaging is currently a rapidly growing field in applied mathematics, with an increasing need for theoretical mathematics. This book, the second of two volumes, emphasizes the role of mathematics as a rigorous basis for imaging sciences. It provides a comprehensive and convenient overview of the key mathematical concepts, notions, tools and frameworks involved in the various fields of gray-tone and binary image processing and analysis, by proposing a large, but coherent, set of symbols and notations, a complete list of subjects and a detailed bibliography. It establishes a bridge between the pure and applied mathematical disciplines, and the processing and analysis of gray-tone and binary images. It is accessible to readers who have neither extensive mathematical training, nor prior knowledge in Image Processing and Analysis. It is a self-contained book focusing on the mathematical notions, concepts, operations, structures, and frameworks that are beyond or involved in Image Processing and Analysis. The notations are simplified as far as possible in order to be more explicative and consistent throughout the book and the mathematical aspects are systematically discussed in the image processing and analysis context, through practical examples or concrete illustrations. Conversely, the discussed applicative issues allow the role of mathematics to be highlighted. Written for a broad audience – students, mathematicians, image processing and analysis specialists, as well as other scientists and practitioners – the author hopes that readers will find their own way of using the book, thus providing a mathematical companion that can help mathematicians become more familiar with image processing and analysis, and likewise, image processing and image analysis scientists, researchers and engineers gain a deeper understanding of mathematical notions and concepts.

Understanding the Bigger Energy Picture Michael Düren, 2017-05-10 This book is open access under a CC BY 4.0 license. This book focuses on the global cycles of energy, water and carbon, which are not only the essentials of our main energy carriers, the fossil fuels, but are also the building blocks of life. The book offers an overview of the basic scientific facts and relationships that are needed to understand today's energy generation and use, how they relate to global climate, the water cycle and other resources, and the complexities of energy policy. Building on the work of the Desertec project, it presents the main technological options that we will have in a world after the "Energiewende" and presents the possible future solutions for a sustainable world. The book is written in an engaging, descriptive style that can be understood by those without specific knowledge of science or economics and allows readers to form their own conclusions. Controversy rages over energy problems, climate change and their possible solutions. Expressions like "climate deniers", "renaissance of nuclear energy", "stop the war on coal", and "Energiewende now" represent a diversity of opinions that divide our society and political leaders. This book shows the reader the whole energy picture and how it is part of the wider global problems of overpopulation and uncontrolled economies in a world of limited resources.

Is there a heaven or a hell? Why are Islamic terrorists not following the teachings of Muhammad? Why does the US Government only back scoundrels in other countries? Why is Johannes Gutenberg the most important individual who ever lived? Of the American, French, and Russian revolutions, why is the French Revolution the most important? What were the three worst decisions made during World War II? What were the two worst decisions made by US presidents? Why did all 22 US intelligence agencies fail to prevent 9/11, even though the preparations were in plain sight? If we meet aliens from other worlds, will we be the colonists or the Indians?
