The Skeleton Paints a Picture Leigh Perry, 2017-10-10 No bones about it, this death is suspicious... "Amateur sleuth Georgia, and her sidekick, Sid, are just plain fun!"—Sofie Kelly, New York Times bestselling author of the Magical Cats Mysteries Georgia Thackery, adjunct English professor, has a new job teaching at Falstone College of Art and Design, known as FAD to its students and faculty. Living in a borrowed bungalow during winter in the snowiest part of Massachusetts, Georgia feels her isolation weighing as heavily as the weather. Then she receives a package containing her best friend, Sid, a walking, talking skeleton who has lived with the Thackery family since Georgia was six. With Georgia working out of town, Sid was lonely too. The two of them make plans for a cozy semester together, and it might have worked out that way if Sid hadn't snuck out in the middle of the night to play in the snow and spotted a crashed car. When he drags Georgia out to investigate, they find the driver behind the wheel, apparently dead from the collision. Initially, police think it's an accident, so Georgia and Sid think that's the end of it—until Georgia finds out the body hits closer to home than she'd realized... "Dr. Georgia Thackery is smart, resourceful, and determined to be a great single mom to her teenager. Georgia is normal in every respect—except that her best friend happens to be a skeleton named Sid. You'll love the adventures of this unexpected mystery-solving duo." —Charlaine Harris, #1 New York Times bestselling author "A very touching and entertaining whodunit. The mystery is intelligent and nicely done with fun insights into academia and anthropology." —RT Book Reviews on *A Skeleton in the Family*

American-Type Options Dmitrii S. Silvestrov, 2015-03-03 The book gives a systematical presentation of stochastic approximation methods for discrete time Markov price processes. Advanced methods combining backward recurrence algorithms for computing of option rewards and general results on convergence of stochastic space skeleton and tree approximations for option rewards are applied to a variety of models of multivariate modulated Markov price processes. The principal novelty of presented results is based on consideration of multivariate modulated Markov price processes and general pay-off functions, which can depend not only on price but also an additional stochastic modulating index component, and use of minimal conditions of smoothness for transition probabilities and pay-off functions, compactness conditions for log-price processes and rate of growth conditions for pay-off functions. The volume presents results on structural studies of optimal stopping domains, Monte Carlo based approximation reward algorithms, and convergence of American-type options for autoregressive and continuous time models, as well as results of the corresponding experimental studies.

Logic Without Borders Åsa Hirvonen, Juha Kontinen, Roman Kossak, Andrés Villaveces, 2015-03-10 In recent years, mathematical logic has developed in many directions, the initial unity of its subject matter giving way to a myriad of seemingly unrelated areas. The articles collected here, which range from historical scholarship to recent research in geometric model theory, squarely address this development. These articles also connect to the diverse work of Väänänen, whose ecumenical approach to logic reflects the unity of the discipline.

Four Silly Skeletons Mark Sperring, 2016-09-08 It's midnight! shouted Skelly Sid. But what do we all care? How can we think of sleeping when there's music in the air ... ? Four silly skeletons dance off with a skip and a hop, and not one of them sees the GREAT BIG DROP! Luckily, Auntie June is there to patch them up. Even if they end up in a bit of a muddle. A rollicking, rhythmical story perfect to read aloud, made even more zany and hilarious by Sue Hendra's bright, bold illustrations. Just right for making kids jump – and then making them laugh.

Guided Inquiry Design® in Action Leslie K. Maniotes, LaDawna Harrington, Patrice Lambusta, 2015-12-07 Supplying classroom-tested lessons and unit plans that can serve as templates, this book demonstrates exactly how to integrate and implement Guided Inquiry Design® (GID) theory into practice. Guided Inquiry is an approach that many educators—thought leaders and practitioners alike—are finding to be well-suited to information-age learning and a way to meet Common Core Standards. For many teachers, librarians, middle school leaders, and curriculum specialists, the biggest challenge is finding examples of guided inquiry in practice applicable to their own context. This guide offers an easy solution, offering ready-to-use templates and models for implementing Guided Inquiry Design® (GID) in the middle school learning environment. With each supplied lesson laid out according to the session plan templates from GID and a thorough description of the ideal inquiry process from beginning to end, integration and implementation of GID is attainable. Besides showing how to put GID to best use to achieve five kinds of learning through inquiry, the book provides an explicit structure for developing instructional partnerships and collaborative teams within the school and with the larger community. It enables teachers, school librarians, and other educational partners to consider and plan for achieving outcomes that bring about deep understanding while also addressing curricular goals. Readers will be better equipped to provide an authentic learning environment using collaboration, discussion, and reflection embedded in the sessions, thereby helping their students to be able to think creatively to solve problems.

Molecular Origins of Brain and Body Geometry Antonio Lima-de-Faria,2014-10-07 New concepts arise in science when apparently unrelated fields of knowledge are put together in a coherent way. The recent results in molecular biology allow to explain the emergence of body patterns in animals that before could not be understood by zoologists. There are no "fancy curiosities" in nature. Every pattern is a product of a molecular cascade originating in genes and a living organism arises from the collaboration of these genes with the outer physical environment. Tropical fishes are as startling in their colors and geometric circles as peacocks. Tortoises are covered with the most regular triangles, squares and concentric circles that can be green, brown or yellow. Parallel scarlet bands are placed side by side of black ones along the body of snakes. Zebras and giraffes have patterns which are lessons in geometry, with their transversal and longitudinal stripes, their circles and other geometric figures. Monkeys, like the mandrills, have a spectacularly colored face scarlet nose with blue parallel flanges and yellow beard. All this geometry turns out to be highly molecular. The genes are many and have been DNA sequenced. Besides they not only deal with the coloration of the body but with the development of the brain and the embryonic process. A precise scenario of molecular events unravels in the vertebrates. It may seem far-fetched, but the search for the origin of this geometry made it mandatory to study the evolution of matter and the origin of the brain. It turned out that matter from its onset is pervaded by geometry and that the brain is also a prisoner of this ordered construction. Moreover, the brain is capable of altering the body geometry and the geometry of the environment changes the brain. Nothing spectacular occurred when the brain arrived in evolution. Not only it came after the eye, which had already established itself long ago, but it had a modest origin. It started from sensory cells on the skin that later aggregated into clusters of neurons that formed ganglia. It also became evident that pigment cells, that decide the establishment of the body pattern, originate from the same cell population as neurons (the neural crest cells). This is a most revealing result because it throws light on the power that the brain has to rapidly redirect the coloration of the body and to change its pattern. Recent experiments demonstrate how the brain changes the body geometry at will and within seconds, an event that could be hardly conceived earlier. Moreover, this change is not accidental it is related to the surrounding environment and is also used as a mating strategy. Chameleons know how to do it as well as flat fishes and octopuses. No one would have dared to think that the brain had its own geometry. How could the external geometry of solids or other figures of our environment be apprehended by neurons if these had no architecture of their own? Astonishing was that the so called "simple cells", in the neurons of the primary visual cortex, responded to a bar of light with an axis of orientation that corresponded to the axis of the cell's receptive field. We tend to consider our brain a reliable organ. But how reliable is it? From the beginning the brain is obliged to transform reality. Brain imagery involves: form, color, motion and sleep. Unintentionally these results led to unexpected philosophical implications. Plato's pivotal concept that "forms" exist independently of the material world is reversed. Atoms have been considered to be imaginary for 2,000 years but at present they can be photographed, one by one, with electron microscopes. The reason why geometry has led the way in this inquiry is due to the fact that where there is geometry there is utter simplicity coupled to rigorous order that underlies the phenomenon where it is recognized. Order allows variation but imposes at the same time a canalization that is patent in what we call evolution.
