**Kennedy Space Center Launch Complex 39 Pad a Historic American Engineering Record, Details of the Apollo-Saturn V and Space Shuttle Rocket Launch Facilities at Cape Canaveral, Florida**  
World Spaceflight News (WSN), U. S. Government, 2019-01-12 The Missile Launch Complex 39A Site was originally listed in the National Register of Historic Places (NRHP) on May 24, 1973, for its association with the Man in Space Program. It was reevaluated in 1996 in the context of the Apollo Program, ca. 1961 through 1975, and on January 21, 2000, the newly defined Launch Complex 39: Pad A Historic District was listed in the NRHP. The Launch Complex 39: Pad A Historic District has since gained importance in the context of the Space Shuttle Program, ca. 1969 to 2010. As currently defined, the historic district contains twenty-one contributing resources and twenty-three noncontributing resources within its boundary. It is considered eligible for listing in the NRHP under Criteria A and C in the areas of Space Exploration and Engineering, respectively. Because it has achieved significance within the past 50 years, Criteria Consideration G applies. The period of significance for the Launch Complex 39: Pad A Historic District, with regards to the Space Shuttle Program, is from 1980, when the first Space Shuttle vehicle arrived at the launch pad, through 2010, the designated end of the Space Shuttle Program. The Space Shuttle Program is the longest running American space program to date. Unlike the Mercury, Gemini and Apollo programs, the emphasis was on cost effectiveness and

reusability, as well as the construction of a space station. The district is one of two sites at the Kennedy Space Center specially designed and constructed to launch the Space Shuttle vehicle; the other site is the Launch Complex 39: Pad B Historic District, also listed in the NRHP on January 21, 2000. It has facilitated nationally significant events associated with space travel, and has been integral to the launching of the Space Shuttle. As such, the Launch Complex 39: Pad A Historic District is of exceptional importance to the Space Shuttle Program. Please note that photographs referenced in this report were not available for this reproduction. As a bonus, this compilation also includes the 11-part Aeronautics and Space Report of the President Fiscal Year 2016 Activities.

*SATURN IB / SATURN V ROCKET PA* Douglas

Aircraft, 2012-06 Developments of America's first heavy lift space rocket Saturn I, the Saturn IB and Saturn V propelled America's space program during the Apollo and Skylab eras. First launched in 1966, Saturn IB replaced the Saturn I's S-IV second stage with the more powerful S-IVB. It could carry a partially fueled Apollo Command / Service Module or fully fueled Lunar Module into low Earth orbit, allowing critical testing of these systems to be conducted long before the Saturn V was ready. It also flew one orbital mission without a payload, with the extra fuel used to demonstrate that the S-IVB's J-2 engine could be restarted in zero gravity - a critical operation for

translunar injection. The Saturn IB produced thrust equivalent to 1.6 million pounds force, and could carry 46,000 pounds of payload to low Earth orbit. Saturn IB flew nine times, including three Skylab missions and for the Apollo-Soyuz Test Project. Saturn V was simply the heaviest, tallest, and most powerful rocket ever built, and capable of carrying the heaviest payload. First launched in 1967, the rocket consisted of three stages, with the S-IVB serving as its third stage. Taller than the Statue of Liberty, Saturn V had a mass of 3000 metric tons and five F-1 engines capable of producing thrust of 7.6 million pounds-force. It could take payloads up to 100,000 pounds beyond Earth orbit or 262,000 pounds into low Earth orbit. It flew thirteen times, including eight times to the moon and (in a two-stage version) on the Skylab I mission. Originally prepared by the Missile and Space Systems Division of NASA contractor Douglas Aircraft, this book was created to acquaint payload planners with the capabilities of the Saturn IB and Saturn V rockets. It shows methods by which Saturn vehicles can accommodate payloads of various weights and volumes for different missions, and methods by which they might be modified to allow even greater performance. It's a wonderful reference for the museum docent, researcher, or anyone who ever wondered how these mighty rockets were designed and built.

**Saturn V Flight Manual** NASA,2012-09 Designed by Wernher von Braun and Arthur Rudolph at NASA's Marshall Space Flight Center, the Saturn V rocket represents the pinnacle of 20th Century technological achievement. The only launch vehicle in history to transport astronauts beyond Low Earth Orbit, the Saturn V delivered 24 men to the moon. To this day it holds records as the tallest (363 feet), heaviest (nearly 7 million lbs.) and most powerful (over 7.6 million pounds-force of thrust) launch vehicle ever produced. It also

remains one of the most reliable, achieving 12 successful launches with one partial failure - the unmanned Apollo 6 which suffered vibration damage on lift-off, resulting in a sub-standard orbit. The Saturn series of rockets resulted from Von Braun's work on the German V-2 and Jupiter series rockets. The Saturn I, a 2-stage liquid-fueled rocket, flew ten times between 1961 and 1965. An upgraded version the 1B carried the first crewed Apollo flight into orbit in 1968. The Saturn V, which first flew in 1967, was a three-stage rocket. The first stage, which burned RP-1 and LOX, consisted of five F-1 engines. The second stage used five J-2 engines which burned LOX and liquid hydrogen (LH2). The third stage, based on the second stage of the Saturn 1B, carried a single J-2. The Saturn V could carry up to 262,000 pounds to Low Earth Orbit and more critically, 100,000 pounds to the Moon. Created by NASA as a single-source reference as to the characteristics and functions of the Saturn V, this manual was standard issue to the astronauts of the Apollo and Skylab eras. It contains information about the Saturn V system, range safety and instrumentation, monitoring and control, prelaunch events, and pogo oscillations. It provides a fascinating overview of the rocket that made one giant leap for mankind possible.

**Launch Magazine's History of American Rocketry** Mark Mayfield, 2021-09-21 A must-have for anyone fascinated by space travel, rocketry, NASA, SpaceX, and more! A new era in spaceflight, led by SpaceX and other commercial rocket companies, is generating the kind of worldwide interest in space travel that we haven't seen since the space race of the 1960s. Kids are dreaming of becoming astronauts again. New feats, such as SpaceX's remarkable ability to land booster rockets, under powered descent, back on land or sea has galvanized a new generation of rocket enthusiasts. Yet none of this would be possible without the advances of rocketry over the past century. The Chinese were the first to develop black-powder fireworks and rockets centuries ago, but modern rocketry truly began with Robert Goddard's launch of a liquid-fueled rocket on a Massachusetts farm in 1926. That metal contraption—which flew just 41 feet high before arching over and streaking 184 feet into a cabbage patch—came just 43 years before Neil Armstrong stepped foot on the moon on July 20, 1969. Armstrong's Apollo 11 mission was made possible by a giant 36-story-tall Saturn V rocket that used some of the same propulsion principles as Goddard's first tiny, crude rockets. The beginning of the "Space Age" is considered to be Russia's launch of the world's first satellite, Sputnik, in 1957. But it was the pioneering

human spaceflights of the 1960s that captured the imagination of the world and turned astronauts into heroes. Weapons of war—the Redstone, Atlas, and Titan II missiles—were converted into civilian launch boosters and led to the success of the Mercury and Gemini programs. All the while, Saturn rockets were being developed that would ultimately lead to the moon missions. Kids were so excited about these pioneering space flights that an entirely new hobby—model rocketry—was created to serve their interests. Small scale models of NASA’s big rockets were ordered by the millions, generating a \$100 million hobby at a time when there were no video games, no internet, and no cable, just three broadcast television networks. Now, the next generation of rockets from SpaceX and other commercial companies, along with NASA’s new launch vehicles and Orion spacecraft, will lead the United States and the world into a new era of rocketry—beginning with crewed flights to the moon as early as 2024, and ultimately to Mars within the first half of this century.

*Saturn I/IB Rocket* David Baker, 2022-04-25 In this eagerly anticipated book, renowned space historian and author David Baker turns his attention to the Saturn I and IB rockets. Although considered as merely a 'stepping stone' from the Mercury and Gemini programs to the mighty Saturn V and the Apollo missions that put the first humans on the Moon, the Saturn I and IB rockets actually played a far more significant role in NASA's manned space effort. As the first American 'heavy lift' rocket, Wernher von Braun's Saturn I traced its lineage right back to his WWII V2 rocket, through Redstone to the Jupiter and Juno projects that lead to the Saturn vehicles. In describing this often-overlooked historical background, the story of the transition of the space program from the US Army to the (then) newly-formed NASA, and the evolution from launching men and

satellites on modified missiles, to flying purpose-built space rockets, is also uncovered. The first Saturn I flew in 1961 and it remained in service until 1975, flying the first manned Apollo mission, testing stages for the Moon flights and launching 'Skylab' astronauts among other accomplishments. Illustrated throughout with NASA technical drawings and photographs, many previously unpublished, this absorbing book also includes a description of each mission flown by the Saturn I and IB.
