Linking the Space Shuttle and Space Stations David J. Shayler, 2017-06-27 How could the newly authorized space shuttle help in the U.S. quest to build a large research station in Earth orbit? As a means of transporting goods, the shuttle could help supply the parts to the station. But how would the two entities be physically linked? Docking technologies had to constantly evolve as the designs of the early space stations changed. It was hoped the shuttle would make missions to the Russian Salyut and American Skylab stations, but these were postponed until the Mir station became available, while plans for getting a new U. S. space station underway were stalled. In *Linking the Space Shuttle and Space Stations*, the author delves into the rich history of the Space Shuttle and its connection to these early space stations, culminating in the nine missions to dock the shuttle to Mir. By 1998, after nearly three decades of planning and operations, shuttle missions to Mir had resulted in:

- A proven system to link up the space shuttle to a space station
- Equipment and hands-on experience in handling tons of materials
- An infrastructure to support space station assembly and resupply

Each of these played a pivotal role in developing the skills and procedures crucial to the creation of the later, much larger and far more complex International Space Station, as described in the companion volume *Assembling and Supplying the ISS: The Space Shuttle Fulfills Its Mission*.

Celebrating 30 Years of the Space Shuttle , NOTE: NO FURTHER DISCOUNT FOR THIS PRINT PRODUCT-- OVERSTOCK SALE -Significantly reduced list price The Space Shuttle fleet set high marks of achievement and endurance through 30 years of missions, from its first on April 12, 1981, to its last, on July 21, 2011. Beginning with the orbiter Columbia and

continuing with Challenger, Discovery, Atlantis, and Endeavour, the National Aeronautics and Space Administration's (NASA) Space Shuttle has carried people into orbit; launched, recovered, and repaired satellites; conducted cutting-edge research; and helped build the largest human made structure in space, the International Space Station. Replete with images and facts of each mission and crew, this book is a tribute to everything accomplished during the 30 years of operation of the Space Shuttle program that defined NASA for an entire generation. The Space Shuttle, Its Story and how to Make a Flying Paper Model Frank Ross, Frank Xavier Ross, 1979 An introduction to the space shuttle -- its history, the construction of its major systems, a typical mission, and what it means in terms of future space travel. Includes instructions for making a simple flying paper model of the spacecraft.

The International Space Station Robert C. Dempsey, 2017 Looks at the operations of the International Space Station from the perspective of the Houston flight control team, under the leadership of NASA's flight directors, who authored the book. The book provides insight into the vast amount of time and energy that these teams devote to the development, planning and integration of a mission before it is executed. The passion and attention to detail of the flight control team members, who are always ready to step up when things do not go well, is a hallmark of NASA human spaceflight operations. With tremendous support from the ISS program office and engineering community, the flight control team has made the International Space Station and the programs before it a success.

Upgrading the Space Shuttle National Research Council, Division on Engineering and Physical Sciences, Commission on Engineering and Technical Systems, Committee on Space Shuttle Upgrades, 1999-01-21 The space shuttle is a unique national resource. One of only two operating vehicles that carries humans into space, the space shuttle functions as a scientific laboratory and as a base for construction, repair, and salvage missions in low Earth orbit. It is also a heavy-lift launch vehicle (able to deliver more than 18,000 kg of payload to low Earth orbit) and the only current means of returning large payloads to Earth.

Designed in the 1970s, the shuttle has frequently been upgraded to improve safety, cut operational costs, and add capability. Additional upgrades have been proposed-and some are under way-to combat obsolescence, further reduce operational costs, improve safety, and increase the ability of the National Aeronautics and Space Administration (NASA) to support the space station and other missions. In May 1998, NASA asked the National Research Council (NRC) to examine the agency's plans for further upgrades to the space shuttle system. The NRC was asked to assess NASA's method for evaluating and selecting upgrades and to conduct a top-level technical assessment of proposed upgrades.

Space Station James Montgomery Beggs,1984

NASA Astronauts on Soyuz World Spaceflight News,National Aeronautics and Space Administration (NASA),2017-04-15 This official NASA document provides an interesting review of NASA's experience working with the Russians and lessons on astronaut safety assurance of the Soyuz spacecraft. This report on Soyuz history was conceived as a possible analogy relevant to domestic commercial spaceflight vehicles. The question of how to human-rate new spacecraft has been asked many times throughout the history of human spaceflight. The U. S., Russia, and, now China have each separately and successfully addressed this question. NASA's operational experience with human-rating primarily resides with Mercury, Gemini, Apollo, Space Shuttle, and the International Space Station (ISS). NASA's latest developmental experience includes Constellation, but also encompasses X38, X33, and the Orbital Space Plane. If domestic commercial crew vehicles are used to transport astronauts to and from space, the Soyuz vehicle would be another relevant example of the methods that could be used to human-rate a spacecraft and how to work with commercial spacecraft providers. As known from history, the first U.S. astronaut to orbit on a Soyuz spacecraft was Thomas P. Stafford on July 17, 1975, during the Apollo-Soyuz Test Project (ASTP) mission. Norman E. Thagard was the first U.S. astronaut to launch on a Soyuz launch vehicle, Soyuz TM-21, on March 14, 1995, on a flight to the Russian Mir Space Station. This flight was associated with the U.S./Russian - Shuttle/Mir Program. The

first Soyuz launched to ISS included astronaut William M. Shepherd, Soyuz TM-31, on October 31, 2000. Prior to this, NASA studied Soyuz as an assured crew return vehicle (ACRV) for Space Station Freedom (SSF) to be launched on the Space Shuttle. Presently, in preparation for Space Shuttle retirement, all U.S. astronauts are being transported to and from ISS in the Russian Soyuz spacecraft, which is launched on the Soyuz launch vehicle. In the case of Soyuz, NASA's normal assurance practices have had to be adapted. For a variety of external reasons, NASA has taken a trust but verify approach to Soyuz and international cargo vehicles. The verify approach was to perform joint safety assurance assessments of the critical spacecraft systems. For Soyuz, NASA's primary assurance was (and continues to be) its long and successful flight history. The other key measure relied on diverse teams of NASA's best technical experts working very closely with their foreign counterparts to understand the essential design, verification, and operational features of Soyuz. Those experts used their personal experiences and NASA's corporate knowledge (in the form of agency, program, center, and other standards) to jointly and independently assess a wide range of topics.

The Space Shuttle David M. Harland, 1998-07-14 Presents the Space Shuttle as a utilitarian craft, focusing on its origins, operations, and importance to many scientific missions.

NASA Cristina T. Chaplain, 2008 The International Space Station (ISS), the most complex

scientific space project ever attempted, remains incomplete. NASA expects the station's final construction cost will be \$31 billion and expects sustainment costs through the station's planned retirement in fiscal year 2016 to total \$11 billion. The space shuttle, the only vehicle capable of transporting large segments of the station into orbit, is critical to its completion. NASA plans to complete ISS assembly and retire the shuttle in 2010 in order to pursue a new generation of space flight vehicles, which will not begin to be available until 2015. To provide crew rotation and logistical support during this 5-year gap, NASA plans to rely on spacecraft developed by the commercial sector and other countries. In light of these circumstances, GAO examined the risks and challenges NASA faces in (1) completing assembly of the ISS by 2010 and (2) providing logistics and maintenance to the ISS after 2010. GAO's work to accomplish this included reviewing budget, planning, and other documents from NASA; reviewing NASA officials' testimonies; and interviewing NASA and foreign space program officials.--Highlights.

It is intended to be a handy reference document, basically one page per flight, and care has been exercised to make it as error-free as possible. This document is basically as flown data and has been compiled from many sources including flight logs, flight rules, flight anomaly logs, mod flight descent summary, post flight analysis of mps propellants, FDRD, FRD, SODB, and the MER shuttle flight data and inflight anomaly list. Orbit distance traveled is taken from the PAO mission statistics.
